Re: **December 2011 Baseline Samples for the Enhanced Bioremediation Treatment System Main Installation - Defense Depot Memphis, Tennessee**

HDR has prepared this report to present results of the December 2011 Baseline Samples for the Enhanced Bioremediation Treatment (EBT) System on the Main Installation (MI) at Defense Depot Memphis, Tennessee (DDMT). This report was prepared for the Department of the Army (DA), Base Realignment and Closure Division (DAIM-ODB) under Contract FA8903-08-D-8771, Task Order 0069 to the Air Force Center for Engineering and the Environment.

INTRODUCTION

Remedial action objectives (RAOs) and the selected remedy were presented in the *Memphis Depot Main Installation Record of Decision* (CH2M HILL, 2001). The RAOs included:

- reduce concentrations of chemicals of concern to maximum contaminant levels (MCLs) or lower; and
- prevent horizontal and vertical offsite migration of groundwater contaminants in excess of MCLs.

The selected remedy included:

- enhanced bioremediation of chlorinated volatile organic compounds (CVOCs) in the most contaminated part of the groundwater plume; and
- long-term groundwater monitoring to document changes in plume concentrations and to detect potential plume migration to off-site areas or into deeper aquifers.

EBT system construction, operations and performance monitoring and long-term monitoring (LTM) were described in the *Interim Remedial Action Completion Report, Main Installation, Rev. 1* (IRACR) (HDR|e²M, 2010), which included an Operating Properly and Successfully (OPS) demonstration. United States Environmental Protection Agency (USEPA) approved the OPS demonstration and the IRACR in March 2010.

EBT system construction included installation of 50 injection wells (IWs) and 30 performance monitoring wells (PMWs) in two target treatment areas (TTA-1 and TTA-2);

construction was completed in August 2006. EBT operations, including injections of sodium lactate solutions and performance monitoring, were performed from September 2006 through March 2009.

EBT injections were halted based on reduction in tetrachloroethene (PCE) and trichloroethene (TCE) concentrations in the treatment areas and the lack of significant contaminant concentrations in identified soil source areas. CVOC isopleths maps and trend analysis of LTM wells indicated plumes were stable and CVOC concentrations had decreased outside the EBT areas; offsite migration of CVOCs in excess of MCLs was not observed. Since completion of EBT, LTM results have shown rebound in concentrations of PCE, TCE and carbon tetrachloride (CT) in TTA-1 and TTA-2.

MI EBT components were planned to be removed following a period of monitoring after injections were halted, but complete removal is not recommended due to rebound in contaminant concentrations. Baseline groundwater monitoring of injection and performance monitoring wells followed by abandonment of selected wells was recommended in the *Work Plan for Partial Abandonment of Enhanced Bioremediation Treatment System* (HDR, 2011). The baseline samples outlined in the work plan was approved by USEPA and Tennessee Department of Environment and Conservation (TDEC) in a conference call on 10 November 2011.

There were 49 IWs and 30 PMWs used for EBT. Six PMWs are currently included in LTM; the remaining wells have not been sampled since March 2009 following the last EBT injections in February 2009. Baseline groundwater samples were collected from these wells in December 2011.

FIELD ACTIVITIES

The field activities consisted of water level measurements in 101 wells throughout TTA-1 and TTA-2, and sampling of 49 IWs and 24 PMWs. The sampled wells are listed on [Table 1](#). The well locations for IWs, PMWs and LTM wells near TTA-1 and TTA-2 are shown on [Figures 1](#) and [2](#), respectively.

Water Level Measurements

Groundwater levels were measured on 5 December 2011. Measurements were made using Solinst Model 101 water level meters with electronic sensors and tapes graduated in 0.01-foot increments. Six wells were not accessible due to heavy rain. The water level measurements are shown on [Table 2](#).

Groundwater Sampling

HDR collected groundwater samples from the designated wells on 5 to 14 December 2011. Groundwater samples were collected using low-flow purging methods. Dedicated Teflon® bladders and Teflon®-lined polyethylene tubing were used for each well. The pumping rate at each well was set such that the water levels would not decline more than 4 inches (0.1 meter).

Water quality parameters were measured at 5 to 10 minute intervals during purging using a flow-through cell with a YSI 6550. The YSI 6550 was calibrated each morning prior to sampling and, if abnormal readings were observed during the day, the instruments were recalibrated in the field. All measurements were recorded on the field sampling forms.

Purging continued at each well for up to two hours in order to meet the stabilization criteria: three successive readings within 0.1 for pH, 10 millivolts for oxygen reduction potential, 5 percent for specific conductance, 10 percent for dissolved oxygen and <20 nephelometric turbidity units (NTUs) for turbidity. Temperature was also measured and recorded but was not used as a stabilization parameter. Samples were collected when stabilization criteria were met or the field team leader approved the variance from the criteria. The final stabilization measurements are shown on [Table 3](#). The following samples were collected without meeting the stabilization criteria:

- Samples were collected from IW-21-02B and IW-21-05A with turbidity values of not recorded and 62 NTUs, respectively. During sampling of IW-21-02B, the turbidity meter malfunctioned and readings were not collected; the sample was visually clear. At well IW-21-05A the sampling team collected the sample when the turbidity reading stabilized as opposed to meeting the 20 NTU criterion.

Samples were sent to Microbac Laboratories in Marietta, Ohio for laboratory analysis. The samples were analyzed for volatile organic compounds (VOCs) by method 8260B.

IDW Management

The waste generated during groundwater sampling in December 2011 was classified as either non-investigative waste or investigation derived waste (IDW). Non-investigative waste, such as packaging materials, personal protective equipment, disposable sampling supplies, and other inert refuse, was collected, containerized, and transported to a designated collection bin for disposal at a municipal landfill.

The IDW consisted of groundwater from purging and equipment decontamination. The water was collected in five gallon buckets with lids and added to the fluvial soil vapor extraction condensate storage tank on Dunn Field. When the storage tank nears capacity, the waste water will be analyzed and, if concentration limits are met, discharged to the storm sewer per agreement with the TDEC.

SUMMARY OF FINDINGS

Water Level Measurements

Groundwater elevations are shown for TTA-1 and TTA-2 on [Figures 3](#) and [4](#), respectively. Groundwater flow near TTA-1 is to the northeast, with an approximate gradient of 0.003 (DR1-1 to DR1-7); flow near TTA-2 is to the west-southwest, with an approximate gradient of 0.07 (IW92-01 to PMW92-04) in the treatment area and 0.01 (PMW92-04 to MW-26) further downgradient.

Analytical Results

The complete analytical results for the 73 groundwater samples collected in December 2011 are presented in [Appendix A](#). [Table 4](#) lists the analytical results for the primary CVOCs [CT, chloroform (CF), cis-1,2-dichloroethene (cDCE), PCE, trans-1,2-dichloroethene, TCE and vinyl chloride (VC)] and for all other VOCs detected above the reporting limit (RL) in one or more samples. A summary of analytical results for the primary CVOCs is provided on [Table 5](#). Data quality evaluation of the analytical results will be presented in the final abandonment report.

A total of 16 VOCs were detected above RLs in the samples. The numbers of wells listed below includes only those with concentrations above the RL.

The analytical results for the primary CVOCs are summarized below:

- CT was reported in 9 wells with a maximum concentration of 102 micrograms per liter ($\mu\text{g}/\text{L}$) in PMW85-01. The MCL (5 $\mu\text{g}/\text{L}$) was exceeded in 6 wells.
- CF was reported in 14 wells with a maximum concentration of 42.5 $\mu\text{g}/\text{L}$ in PMW85-01. The MCL (80 $\mu\text{g}/\text{L}$ for total trihalomethanes) was not exceeded.
- cDCE was reported in 50 wells with a maximum concentration of 201 $\mu\text{g}/\text{L}$ in IW92-06. The MCL (70 $\mu\text{g}/\text{L}$) was exceeded in 16 wells.
- PCE was reported in 64 wells with a maximum concentration of 280 $\mu\text{g}/\text{L}$ in PMW21-01. The MCL (5 $\mu\text{g}/\text{L}$) was exceeded in 57 wells.
- Trans-1,2-Dichloroethene was reported in PMW85-01 at a concentration of 2.01 $\mu\text{g}/\text{L}$, below the MCL of (100 $\mu\text{g}/\text{L}$).
- TCE was reported in 47 wells with a maximum concentration of 127 $\mu\text{g}/\text{L}$ in PMW101-08B. The MCL (5 $\mu\text{g}/\text{L}$) was exceeded in 30 wells.
- VC was reported in IW101-09C at a concentration of 56.6 $\mu\text{g}/\text{L}$, above the MCL of (2 $\mu\text{g}/\text{L}$).

The analytical results for other VOCs are summarized as follows:

- 1,2-Dichloroethane was reported in four wells with a maximum of 1.63 $\mu\text{g}/\text{L}$ in IW21-02A.
- 1,2,3-Trichloropropane was reported in eight wells with a maximum concentration of 82.9 $\mu\text{g}/\text{L}$ in PMW85-05.
- 1,2-Dichloropropane was reported in five wells with a maximum concentration of 6.59 $\mu\text{g}/\text{L}$ in IW85-06.
- 1,3-Dichloropropane was reported in five wells with a maximum concentration of 6.17 $\mu\text{g}/\text{L}$ in IW85-06
- Acetone was reported in six wells with a maximum concentration of 79 $\mu\text{g}/\text{L}$ in IW92-05.
- Carbon disulfide was reported in IW92-07 at a concentration of 1.05 $\mu\text{g}/\text{L}$.
- Chlorobenzene was reported in PMW85-04 at a concentration of 0.524 $\mu\text{g}/\text{L}$.
- MEK (2-Butanone) was reported in two wells with a maximum concentration of 129 $\mu\text{g}/\text{L}$ in IW101-09C.
- Methyl t-butyl ether was reported in eleven wells with a maximum concentration of 123 $\mu\text{g}/\text{L}$ in IW21-04B.

Plume Maps

Isoconcentration maps were created using these baseline sample results and the October 2011 results for LTM wells near TTA-1 and TTA-2. The isopleths are shown on [Figures 5](#) (PCE) and [6](#) (TCE) for TTA-1 and [Figures 7](#) (PCE), [8](#) (TCE) and [9](#) (CT) for TTA-2. The isopleths are similar to those from 2011 LTM, but provide additional detail showing residual effects from EBT.

Rebound

Analytical results for PCE, TCE and CT from the August-September 2006 pre-EBT baseline samples, the March 2009 samples (after final EBT injections in February 2009) and the December 2011 samples are shown on [Tables 6, 7 and 8](#). Four wells in TTA-2 (IW-85-05, IW85-06, PMW-85-04 and PMW85-05) were installed in February 2007 and results from the initial March 2007 samples are shown. The latest results for the six performance monitoring wells currently included in LTM are from October 2011 not December. Concentrations above 100 µg/L, the concentration used to select EBT treatment areas, are highlighted. The percentage change in concentration from August 2006 to December 2011 is shown for those wells with initial concentrations above 10 µg/L.

The results are discussed by area below. CT was not detected above the RL in TTA-1 wells during any of the three sample events, and those results are discussed for TTA-2 only.

TTA-1S

The PCE results on [Table 6](#) show 18 of 43 wells in TTA-1S had concentrations above 100 µg/L in August 2006 and no wells exceeded that concentration in December 2011. The latest results average 36% of the pre-EBT baseline. The 2011 PCE results were higher than the March 2009 results at almost all wells.

The TCE results on [Table 7](#) show eight wells in TTA-1S had concentrations above 100 µg/L in August 2006 and two of those wells exceeded that concentration in December 2011. The latest results average 40% of the pre-EBT baseline. The 2011 TCE results were higher than the March 2009 results at many wells where initial concentrations were elevated (> 20 µg/L).

TTA-1N

The PCE results on [Table 6](#) show 9 of 15 wells in TTA-1N had concentrations above 100 µg/L in August 2006 and the same number exceeded that concentration in December 2011. The latest results average 110% of the pre-EBT baseline. The 2011 PCE results were higher than the March 2009 results at all but two wells.

The TCE results on [Table 7](#) show no wells in TTA-1N had concentrations above 100 µg/L in August 2006 or December 2011. The average TCE concentrations were 42 µg/L in pre-EBT baseline samples and 28 µg/L in the latest samples. The 2011 TCE results were higher than the March 2009 results at most wells.

TTA-2

The PCE results on [Table 6](#) show 13 of 21 wells in TTA-2 had concentrations above 100 µg/L in August 2006 and 4 of those wells exceeded that concentration in December 2011. The latest results average 35% of the pre-EBT baseline. The 2011 PCE results were higher than the March 2009 results at many wells.

The TCE results on [Table 7](#) show no wells in TTA-2 had concentrations above 100 µg/L in August 2006 or December 2011. The average TCE concentrations were 15 µg/L in

pre-EBT baseline samples and 8 µg/L in the latest samples. The 2011 TCE results were higher than the March 2009 results at most wells, but concentrations remained low.

The CT results on [Table 8](#) show 6 wells in TTA-2 had concentrations above 100 µg/L in August 2006 and 2 of those wells exceeded that concentration in December 2011. The latest results average 30% of the pre-EBT baseline. The 2011 CT results were higher than the March 2009 results at several wells.

CONCLUSIONS AND RECOMMENDATION

The samples from IWs and PMWs in TTA-1 and TTA-2 indicate rebound in the concentrations of parent compounds, with increasing concentrations of PCE in all areas, TCE in TTA-1S and CT in TTA-2. Concentrations have returned to pre-EBT baseline levels throughout TTA-1N. Concentrations in TTA-1S and TTA-2 are approximately one-third of pre-EBT baseline levels on average and the isopleths on [Figures 5 to 9](#) indicate areas with varying rebound.

Based on the increased concentrations in TTA-1 and TTA-2, LTM results throughout the MI and concentrations above MCLs in the intermediate aquifer, additional EBT is recommended. The recommendation is made to improve progress toward groundwater RAOs, decrease the time required for LTM and reduce potential for impacts to the Memphis Aquifer. The October 2011 LTM results for PCE and TCE are shown on [Figures 10 and 11](#).

EBT is recommended in areas where individual CVOC concentrations of parent compounds (PCE, TCE and CT) exceed 100 µg/L; this would include TTA-1, TTA-2, the west-central plume and the Bldg 835 plume. Within TTA-1 and TTA-2, injections would be made in areas where previous EBT has reduced concentrations below 100 µg/L.

Performance monitoring and LTM since EBT was implemented in 2006 indicated significant migration and diffusion of carbon source material up to 2,000 feet downgradient of the treatment area. The observed increase in the area of reductive dechlorination demonstrates that rows of injection wells in the treatment areas are not necessary as long as sufficient mass of carbon substrate is available. Higher concentrations of sodium lactate in the injection solution will be used to provide an equivalent mass of carbon through fewer wells and less frequent injections. Monitoring wells will be used to expand the treatment areas as done previously. Installation of additional injection wells is not planned. Based on results of the initial EBT at the MI and approval of the OPS demonstration, performance monitoring in the treatment area will be limited with success of additional EBT determined through LTM outside the treatment areas.

The wells recommended for injections and performance monitoring are listed on [Table 9](#). The remaining IWs and PMWs, which are listed on [Table 10](#), are recommended to be abandoned. The recommendations for TTA-1 and TTA-2 are shown on [Figures 12 and 13](#).
