1.0 INTRODUCTION

HDR has prepared this 2011 Annual Monitoring Report for Off Depot Groundwater at Dunn Field on Defense Depot Memphis, Tennessee (DDMT) under Contract FA8903-08-D-8771, Task Order 0069 to the Air Force Center for Engineering and the Environment (AFCEE). Off Depot groundwater monitoring includes performance monitoring and long term monitoring (LTM). Groundwater performance monitoring results are used to assess the effectiveness of the air sparging with soil vapor extraction (AS/SVE) system. LTM is used to document changes in plume concentrations, detect potential plume migration to off-site areas or into deeper aquifers, and track progress toward remediation goals (RGs). Groundwater monitoring was performed in accordance with the *Off Depot Groundwater Final Remedial Design, Rev. 1* (Off Depot Groundwater RD) (CH2M HILL, 2008), including the *Long-Term Groundwater Monitoring Plan* (LTM Plan) in Appendix C.

1.1 SITE LOCATION AND DESCRIPTION

DDMT is located in southeastern Memphis, Shelby County, Tennessee approximately 5 miles east of the Mississippi River and just northeast of Interstate 240 ([Figure 1](#)). DDMT originated as a military facility in the early 1940s; it received, warehoused, and distributed supplies common to all United States (U.S.) military services and some civil agencies located primarily in the southeastern U.S., Puerto Rico, and Panama. Stocked items included food; clothing; petroleum products; construction materials; and industrial, medical, and general supplies. In 1995, DDMT was placed on the list of the Department of Defense facilities to be closed under Base Realignment and Closure. Storage and distribution of material continued until the facility closed in September 1997.

DDMT covers approximately 642 acres and includes the Main Installation (MI) and Dunn Field. The MI contains approximately 578 acres with open storage areas, warehouses, former military family housing, and outdoor recreational areas. Dunn Field, which is located across Dunn Avenue from the north-northwest portion of the MI, contains approximately 64 acres and includes former mineral storage and waste disposal areas.

In 1992, DDMT was added to the National Priorities List (NPL) (57 Federal Register 47180 No. 199). Responsibility for environmental restoration activities at DDMT transferred from the Defense Logistics Agency to the Department of the Army in December 2010. The regulatory oversight agencies are U.S. Environmental Protection Agency (USEPA) Region 4 and the Tennessee Department of Environment and Conservation (TDEC). DDMT's USEPA Identification Number is TN4210020570.

1.2 GEOLOGY AND HYDROGEOLOGY

The geologic units of interest at Dunn Field are (from youngest to oldest): loess, including surface soil; fluvial deposits; Jackson formation/Upper Claiborne group; and Memphis Sand.

The loess consists of wind-blown and deposited brown to reddish-brown, low-plasticity clayey silt to silty clay. The loess deposits are about 20 to 30 feet thick and are continuous throughout the Dunn Field area.

The fluvial (terrace) deposits consist of two general layers. The upper layer is a silty, sandy clay that transitions to a clayey sand and ranges from about 10 to 36 feet thick. The lower layer is composed of interlayered sand, sandy gravel, and gravelly sand, and has an average thickness of approximately 40 feet. The uppermost aquifer is the unconfined fluvial aquifer, consisting of saturated sands and gravelly sands in the lower portion of the deposits. Recharge to this unit is mainly from rainfall infiltration; discharge is to underlying units or laterally into adjacent stream channels. The saturated thickness of the fluvial aquifer ranges from 3 to 50 feet and is controlled by the configuration of the uppermost clay in the Jackson Formation/Upper Claiborne Group. The groundwater in the fluvial aquifer is not a drinking water source for area residents.

The Jackson Formation/Upper Claiborne Group consists of clays, silts, and sands. The uppermost clay unit appears to be continuous, except in the southwestern area of Dunn Field. Off site, to the west and northwest of Dunn Field, there are possible gaps in the clay. Where present, these gaps create connections to the underlying intermediate aquifer (IAQ) from the fluvial deposits. The IAQ is locally developed in deposits of the Jackson Formation/Upper Claiborne Group.

The Memphis Sand primarily consists of thick-bedded, white to brown or gray, very fine-grained to gravelly, partly argillaceous and micaceous sand. The Memphis Sand ranges from 500 to 890 feet in thickness and begins at a depth below ground surface (bgs) of approximately 120 to 300 feet. The top of the Memphis Sand was identified at 255 feet bgs (elevation of 21 feet above msl) in MW-67, the first monitoring well (MW) completed in the Memphis Sand at DDMT. The Memphis aquifer (MAQ) is confined by overlying clays and silts in the Cook Mountain formation (part of the Jackson/Upper Claiborne group) and contains groundwater under strong artesian (confined) conditions regionally. The City of Memphis obtains the majority of its drinking water from this unit. The Allen Well Field, which is operated by Memphis Light, Gas and Water, is located approximately two miles west of DDMT.

1.3 REMEDIAL ACTION

1.3.1 Interim Remedial Action

The *Record of Decision for Interim Remedial Action* was signed in April 1996, with the objective of hydraulic containment to prevent further contaminant plume migration and reduce contaminant mass in groundwater. The Interim Remedial Action (IRA) groundwater recovery system included 11 recovery wells (RWs) screened in the fluvial aquifer and located along the western boundary of Dunn Field. Based on reduction of chlorinated volatile organic compound (CVOC) concentrations in groundwater following implementation of the Dunn Field Source Areas remedial action (RA), five RWs were shutdown on in June 2008 and the remaining RWs were shutdown in January 2009. The IRA system was removed and the RWs abandoned in July 2010.

1.3.2 Record of Decision and Amendment

The *Memphis Depot Dunn Field Record of Decision* (Dunn Field ROD) (CH2M HILL, 2004) was finalized in April 2004. The selected remedy addresses surface soil, material within disposal sites and associated soil, and CVOCs in subsurface soil and groundwater. The RA objectives (RAOs) established in the Dunn Field ROD for groundwater are:

- Prevent human exposure to contaminated groundwater (i.e., exceeding protective target concentrations [TC])
- Prevent further off-site migration of volatile organic compounds (VOCs) in excess of protective target levels
- Remediate fluvial aquifer groundwater to drinking water quality to be protective of the deeper MAQ

The major components of the selected remedy from the Dunn Field ROD are:

- Excavation, transportation, and disposal of soil and material contained within disposal sites based upon results from a pre-design investigation
- Soil vapor extraction (SVE) to reduce VOC concentrations in subsurface soils to levels that are protective of the intended land use and groundwater
- Injection of zero valent iron within Dunn Field to treat CVOCs in the most contaminated part of the groundwater plume, and installation of a permeable reactive barrier (PRB) to remediate CVOCs within the off-site areas of the groundwater plume

- Monitored natural attenuation and LTM of groundwater to document changes in plume concentrations, detect potential plume migration to off-site areas or into deeper aquifers, and track progress toward remediation goals
- Implementation of land use controls, which consist of the following institutional controls: Deed and/or lease restrictions; Notice of Land Use Restrictions; City of Memphis/Shelby County zoning restrictions and the Memphis and Shelby County Health Department groundwater well restrictions.

The selected remedies were modified through the *Dunn Field Record of Decision Amendment* (ROD Amendment) (e²M, 2009) approved in January 2009. The major changes were the use of AS/SVE instead of a PRB for the Off Depot groundwater plume and the addition of in situ thermal desorption to enhance SVE in the loess on Dunn Field. Construction of the selected remedies has been completed. The *Source Areas Interim Remedial Action Completion Report, Revision 1* (Source Areas IRACR) (HDR|e²M, 2009) was approved by USEPA and TDEC in November 2009. The *Preliminary Close Out Report* (USEPA, 2010) was approved in May 2010 and the DDMT NPL site status was revised to Construction Complete. The *Dunn Field Off Depot Groundwater Interim Remedial Action Completion Report, Revision 1* (Off Depot IRACR) (HDR, 2011a) was approved by USEPA in August 2011 and by TDEC in November 2011.

1.3.3 Remedial Action Operations

Two RA systems are currently operating at Dunn Field, the fluvial soil vapor extraction (FSVE) system in the Source Areas on Dunn Field and the AS/SVE system located in the Off Depot groundwater plume west of Dunn Field.

The FSVE system consists of two blowers connected to seven SVE wells with screened intervals at approximately 30 to 70 feet bgs. The FSVE system layout is shown on [Figure 2](#). System operations began in July 2007 and approximately 4,020 pounds of VOCs were removed through July 2011. The VOC concentration in the extracted vapor has decreased asymptotically to less than 1 part per million. The FSVE system was shutdown October 2010 to January 2011 for a rebound test and confirmation soil sampling to evaluate progress toward remediation goals. The soil sample results met RAOs and the FSVE system will be shutdown in July 2012; groundwater samples collected during LTM will be reviewed for rebound in groundwater concentrations.

The AS/SVE system consists of a compressor connected to 90 air sparge points at the base of the Fluvial aquifer and two blowers connected to 12 SVE wells with screened intervals at approximately 40 to 75

feet bgs. The AS/SVE system layout is shown on [Figure 3](#). System operations began in December 2009. Approximately 74 pounds of VOCs have been removed through September 2011 and CVOC concentrations within the plume passing through the treatment area (TA) are below the goal of 50 micrograms per liter ($\mu\text{g}/\text{L}$) for individual analytes. Further reduction to the remediation goals are to be achieved through natural attenuation.

1.4 PREVIOUS GROUNDWATER MONITORING

The Dunn Field ROD identified three CVOC plumes in the fluvial aquifer underlying Dunn Field. Mixing and intermingling of the plumes have occurred due to the active groundwater extraction system and natural groundwater flow. The nine CVOCs listed below have been detected most frequently in past groundwater sampling events:

- Tetrachloroethene (PCE)
- Trichloroethene (TCE)
- cis-1,2-Dichloroethene (cDCE)
- trans-1,2-Dichloroethene (tDCE)
- 1,1-Dichloroethene (DCE)
- 1,1,2,2-Tetrachloroethane (TeCA)
- 1,1,2-Trichloroethane (TCA)
- Carbon tetrachloride (CT)
- Chloroform (CF)

The highest groundwater contaminant concentrations were detected in the central plume. The individual CVOCs with the highest concentrations are TeCA and TCE, with maximum concentrations up to 40,800 $\mu\text{g}/\text{L}$ for TeCA and 7,110 $\mu\text{g}/\text{L}$ for TCE (MW-73; October 2003).

Regular groundwater monitoring in the Dunn Field area at DDMT was performed as part of the IRA from 1999 through 2009. Beginning in 2010, groundwater monitoring was conducted in accordance with the Off Depot Groundwater RD and consisted of performance monitoring in the AS/SVE TA and LTM in the remainder of the plume. There were 36 monitoring wells used for performance monitoring and 58 monitoring wells used for LTM. Another 20 monitoring wells were used for water level measurements during LTM events.

The LTM plan classified the monitoring wells in three categories:

- Background – wells screened in the fluvial aquifer located along or outside of the Dunn Field boundary; located upgradient to or at a distance from contaminant plumes on Dunn Field; no (or only low-level) previous detections of site contaminants in well samples.
- Sentinel – wells screened within either the fluvial or intermediate aquifers adjacent to or within the window to the IAQ.

- Performance – wells screened in the fluvial aquifer; located within the limits of known contaminant plumes; or repeatedly have contaminants in samples; located in areas targeted for treatment during the RA.

The LTM plan established an initial sampling frequency (biennial, annual or semiannual) for 58 existing wells: biennial, annual and semiannual. The performance monitoring wells (PMWs) were sampled quarterly in 2010 and semiannually in 2011; the PMWs will be incorporated into LTM in 2012.

The initial year of AS/SVE operations and performance monitoring in 2010 were described in the Off Depot IRACR and LTM was described in *Off Depot Groundwater Annual Long-Term Monitoring Report-2010* (HDR, 2011b).

The Off Depot IRACR stated that the overall performance of the Off Depot RA in Year 1 was excellent based on system operating parameters and performance monitoring. The treatment goal for the AS/SVE system is to reduce groundwater concentrations downgradient of AS/SVE barrier below 50 µg/L for individual CVOCs. The goal was met in all 5 PMWs immediately downgradient of the AS/SVE barrier in June 2010. The highest total CVOC concentration in October 2009 pretreatment PMW samples was 4607 µg/L in MW-246; the concentration in MW-246 was reduced 99.7 percent to 13.5 µg/L in January 2011. In January 2011, CVOC concentrations in the Off Depot plume met the treatment goal of 50 µg/L for individual CVOCs in all but five PMWs, including all wells downgradient of the AS/SVE system. The highest total CVOC concentration in January 2011 PMW samples was 327 µg/L at MW-159, which is upgradient of the AS/SVE barrier.

As described in the ROD Amendment, the AS/SVE system in combination with natural attenuation processes is expected to reduce groundwater concentrations to maximum contaminant levels (MCLs) within a reasonable period of time. Based on the Off Depot treatment goal, individual CVOC concentrations in wells on Dunn Field are not to exceed 50 µg/L after RA unless the groundwater will pass through the Off Depot TA. The AS/SVE system will continue to operate until the influent (upgradient) concentrations from the Dunn Field plume do not exceed 50 µg/L for individual CVOCs. Only 3 of the 32 LTM wells sampled in 2010 contained individual CVOC concentrations above 50 µg/L; the highest concentrations were at MW-144 in the central portion of the plume, which contained TeCA at 150 µg/L and TCE at 109 µg/L.

Of the 32 Off Depot LTM wells sampled in 2010, 10 wells had primary CVOC concentrations above an MCL or above the TC for TeCA. Nine of the wells (MW-6, MW-15, MW-57, MW-87, and MW-225) are located in the central portion of the source areas; concentration limits were exceeded for TCE in six wells

(7.57 µg/L to 109 µg/L), TeCA in seven wells (2.67 µg/L to 150 µg/L) and CT in one well (6.71 µg/L). The tenth well is located northeast of Dunn Field and is within the plume originating from an off-site source northeast of Dunn Field; CVOC concentrations exceeded the MCLs for PCE (22.7 µg/L), TCE (20.4 µg/L) and DCE (22.7 µg/L).

A few changes were recommended in the 2010 Off Depot LTM report. Well MW-175, damaged during thermal SVE in 2008, was recommended for abandonment. Recommended sample frequencies were changed from annual to biennial at three background wells (MW-172, MW-178 and MW-187), from semiannual to annual at one performance well (MW-147) and from biennial to annual at three performance wells (MW-05, MW-91 and MW-184). The changes were implemented in 2011, except that MW-175 was omitted from LTM sampling but was not abandoned; abandonment is planned in 2012.

2.0 GROUNDWATER MONITORING

Groundwater monitoring activities during 2011 consisted of water level measurements and groundwater sampling of all PMWs in March-April and September and of all LTM wells in a biennial event in April. Field activities and laboratory analyses were performed in accordance with the *Remedial Action Sampling and Analysis Plan* (RA SAP) (MACTEC Engineering and Consulting, Inc., 2005).

The 57 LTM wells selected for periodic sampling are classified as background (9), performance (35) or sentinel (13) wells and assigned annual (31) or biennial (26) sampling frequencies. An additional 20 LTM wells are used for water level measurements only. The LTM wells are listed on [Table 1](#) and the locations are shown on [Figure 4](#). The 36 PMWs are listed on [Table 2](#) and the locations are shown on [Figure 5](#). The current well classification, sample frequency and 2011 sampling events are shown for LTM wells on [Table 3](#) and for PMWs on [Table 4](#).

2.1 FIELD ACTIVITIES

Groundwater levels were measured in all PMWs and LTM wells during each sample event. Measurements were made using Solinst Model 101 water level meters with electronic sensors and tapes graduated in 0.01-foot increments. The measurements were coordinated with those for sample events on the MI to provide site wide data for later use if needed. The water level measurements are shown on [Table 5](#). Water levels were not measured in a few wells during each event because of inaccessibility or other factors, but the data were sufficient for creating contour maps.

During the September sample event, the water level in MW-32 was measured at 20.6 feet bgs; upon further inspection the well was found to be blocked with soil near that depth. The casing had a break about 1 foot bgs where it appeared to have been pushed sideways; the cause of the movement was not apparent. The soil in MW-32 will be cleared and the well re-developed, if possible.

Groundwater samples were collected using either passive diffusion bags (PDBs) or low-flow purging methods. Water levels were measured approximately one month prior to sample collection. If saturated thickness of the well screen was greater than 5 feet, a PDB was installed, if not already present. If the saturated thickness was less than 5 feet, the well was selected for low-flow sampling.

When samples were collected using a PDB, a sample of water from the PDB removed from the well was transferred to 40-milliliter vials preserved with hydrochloric acid. Following sample collection, a new PDB was filled with de-ionized water and placed in the middle of the saturated section of well screen.

When samples were collected using bladder pumps and low-flow purging methods, dedicated Teflon® bladders and Teflon®-lined polyethylene tubing were used. The pumping rate at each well was monitored in order that the water levels not decline more than 4 inches (0.1 meter). Following sampling, the bladder and tubing for each well were placed in separate, sealed plastic bags and stored for future sampling events. Water quality parameters were measured at approximately 5 to 10 minute intervals during purging using a flow-through cell with a YSI 600XLM and a LaMotte 2020e turbidity meter. The units were calibrated each morning prior to sampling, and if abnormal readings were observed during the day, the instruments were recalibrated in the field. Purging continued at each well for up to two hours in order to meet the stabilization criteria: three successive readings within 0.1 for pH, 10 millivolts for oxygen reduction potential, 3 percent for specific conductance, 10 percent for dissolved oxygen and less than 20 nephelometric turbidity units for turbidity. Temperatures were also measured and recorded, but not used as a stabilization parameter. All measurements were noted on the field sampling forms. Samples were collected in 40-milliliter vials preserved with hydrochloric acid when stabilization criteria were met or the field team leader approved the variance from the criteria.

Samples were sent to Microbac Laboratories in Marietta, Ohio for VOC analysis by Method SW8260B. The activities during each sampling event are summarized in the following sections.

2.1.1 March-April 2011

Water levels were checked in PMWs and LTM wells with thinner saturated zones on 1 March; all PMWs and 51 LTM wells were selected for sampling with PDBs, and 6 LTM wells were selected for low-flow sampling.

Groundwater samples were initially collected from PMWs and LTM wells on 28 and 29 March. HDR was notified of a problem with sample storage at the analytical laboratory, Microbac, on 7 April. A refrigerated storage unit at the laboratory malfunctioned and sample temperatures reached 9-19 degrees Celsius (°C), well above the required upper limit of 6°C. All LTM samples and 7 PMW samples were determined to be unusable. The affected samples were re-collected on 25 to 29 April by HDR with all sampling costs charged to Microbac.

2.1.1.1 LTM

Biennial groundwater samples were collected from all 57 LTM wells on 28 and 29 March and re-collected on 25 to 29 April. Samples were collected using PDBs in 51 LTM wells. PDB sample intervals are shown on [Table 6](#). Groundwater samples were collected using bladder pumps and low-flow purging

methods in 6 monitoring wells. The final stabilization measurements are shown on [Table 7](#). Stabilization criteria were met at all wells.

2.1.1.2 Performance Monitoring

Groundwater samples were collected from 36 PMWs on 28 March 2011; samples were re-collected at 7 PMWs on 25 April 2011. All samples were collected using PDBs; sample intervals are shown on [Table 8](#).

2.1.2 September 2011

Water levels were checked in PMWs with thinner saturated zones on 9 September 2011; all PMWs were selected for sampling with PDBs. No LTM wells were designated for sampling in September 2011.

Groundwater samples were collected from 36 PMWs. Samples were collected from 35 PMWs on 26-27 September using PDBs; sample intervals are shown on [Table 9](#). The PDB in MW-160 was empty when brought to the surface. The groundwater sample from MW-160 was collected on 27 September using a bladder pump and low-flow purging. The stabilization criteria were met after approximately 1 hour of purging; the final stabilization measurements are shown on [Table 10](#).

2.2 WASTE DISPOSAL

The waste generated during groundwater sampling was classified as either non-investigative waste or investigation-derived waste. Non-investigative waste, such as packaging materials, personal protective equipment, disposable sampling supplies, and other inert refuse, was collected and placed in a designated collection bin for disposal at a municipal landfill.

The groundwater from purging and wastewater from equipment decontamination was collected in 5-gallon buckets with lids and added to the FSVE condensate water storage tank on Dunn Field. When the storage tank nears capacity, a waste water sample will be collected and submitted for laboratory analysis prior to discharge.

3.0 SUMMARY OF MONITORING RESULTS

3.1 HYDROGEOLOGY

Water level measurements for the 2011 Off Depot events are shown on [Table 5](#). Groundwater contour maps for each event are shown on [Figures 6](#) and [7](#). The groundwater elevation contour maps are similar. Groundwater flow is generally to the west on Dunn Field. The maps show a trough in groundwater elevations approximately 1,000 feet west of Dunn Field, with flow apparently diverging to the north and south. The AS/SVE system is located on the eastern side of the trough.

Groundwater elevations in the fluvial aquifer are highest northeast of Dunn Field (MW-65: 257.29 feet mean seal level [msl] in March and 250.34 msl in September) and decrease toward the trough west of Dunn Field (MW-165: 218.32 feet msl in March and 218.33 feet msl in September). The spatial variation in water levels in the fluvial aquifer monitoring wells is primarily due to the elevation of the underlying clay of the Jackson Formation/Upper Claiborne Group.

The groundwater elevations in IAQ wells away from the ‘windows’ providing connection with the fluvial aquifer were approximately 167-168 feet msl in March and 160-162 feet msl in September. The groundwater elevation in MW-67, which is screened in the Memphis Sand, was approximately 168.4 feet msl in March and 160.1 feet in September.

3.2 DATA QUALITY EVALUATION

Data collected during the sampling events in March, April and September 2011 were reviewed based on guidelines in the RA SAP. The review process was performed by an independent data validation contractor, Diane Short and Associates, Inc. Based on the review and the project data quality objectives (DQOs), the data are acceptable and usable. No data were rejected. The complete analytical results with data quality evaluation (DQE) flags are presented in [Appendix A](#).

There were qualifications of VOC data, with the primary causes of the qualified data described below.

- Rinsate blank contamination resulted in a number of qualifications (1,4-dichlorobenzene in 20 samples, CF in 11 samples and acetone in four samples) in the April LTM event. The detections in the associated samples were less than 5x the blank; the results are qualified as B.
- A number of samples had high associated laboratory control sample (LCS) recoveries and other samples had low LCS recoveries in all three events. When a high recovery is associated with a

non-detect, no qualifier is added since the indicated bias is high. When a low recovery is associated with a non-detect, the result is qualified as estimated UJ. When the target is detected with either a high or low LCS recovery, the result is qualified as estimated J. The analytes that were recovered high or low were qualified accordingly.

- Bromomethane and dichlorodifluoromethane were non-detect and qualified as estimated UJ in one sample (MW-70-ODPM-8) in the March-April PM event based on matrix spike/matrix spike duplicate recovery.
- Any result reported below the reporting limit (RL) but above the method detection limit was flagged “J” and considered an estimated result (unless overridden by other quality control [QC] flags).

Overall, the VOC data from the three events met project DQOs and were determined to be sufficient to support the evaluation of RA. The complete DQE for 2011 Off Depot groundwater monitoring is provided in [Appendix B](#).

3.3 ANALYTICAL RESULTS

The complete analytical results are shown in [Appendix A](#). Summary tables for each sampling event list the analytical results for the primary CVOCs detected at Dunn Field: CT, CF, DCE, tDCE, cDCE, TeCA, PCE, TCA, and TCE and for vinyl chloride (VC), a significant CVOC degradation product. The MCLs and groundwater TCs from the Dunn Field ROD are also shown on the summary tables.

3.3.1 March-April 2011

3.3.1.1 LTM

Groundwater samples were collected from all 57 LTM wells for the biennial event in April 2011. [Table 11](#) lists the analytical results for the primary CVOCs and for other VOCs detected above the RL in one or more samples. Ten VOCs were detected above RLs. A summary of the primary CVOC results is provided on [Table 12](#).

Total CVOC concentrations continue to decrease in the Off Depot plume. The highest total CVOC concentration in the LTM wells was 69.4 µg/L in MW-144, a reduction from 264 µg/L in the previous sample from April 2010. All LTM wells met the active treatment goal of individual CVOC concentrations below 50 µg/L.

3.3.1.2 Performance Monitoring

Groundwater samples were collected from all 36 PMWs in March-April 2011. [Table 13](#) lists the analytical results for the primary CVOCs and for other VOCs detected above the RL in one or more samples. Eleven VOCs were detected above RLs. A summary of the primary CVOC results is provided on [Table 14](#).

The active treatment goal of individual CVOC concentrations below 50 µg/L was met in all but four PMWs: MW-149 (CF at 75.2 µg/L), MW-159 (TCE at 232 µg/L and cDCE at 50.7 µg/L), MW-166 (TCE at 129 µg/L) and MW-165A (TeCA at 79 µg/L). The highest total CVOC concentrations in the PMWs was 364 µg/L in MW-159, a reduction from 726 µg/L in March 2010. The total CVOC concentration in MW-165A increased to 93.8 µg/L from 39.4 µg/L in January 2011; the increase may be due to reduced AS/SVE system operations or plume diversion around the southwest end of the system. However, plume diversion does not appear to be significant because total CVOC concentrations in MW-166 and MW-166A at the southern edge of the TA decreased to 183 µg/L and 73.5 µg/L from 205 µg/L and 123 µg/L in January 2011. In addition, total CVOC concentrations at MW-247, which had increased to 60.4 µg/L in January 2011 possibly due to the reduced system operations, decreased to 33 µg/L.

3.3.2 September 2011

No LTM wells were designated for sampling in September 2011. Groundwater samples were collected from all 36 PMWs in September 2011. [Table 15](#) lists the analytical results for the primary CVOCs and for other VOCs detected above the RL in one or more samples. Eleven VOCs were detected above RLs. A summary of the primary CVOC results is provided on [Table 16](#).

The active treatment goal of individual CVOC concentrations below 50 µg/L was met in all but three PMWs: MW-159 (TCE at 193 µg/L), MW-166 (TCE at 50.2 µg/L and CF at 67.5 µg/L) and MW-166A (CF at 54.4 µg/L). The highest total CVOC concentrations in the PMWs was 311 µg/L in MW-159, a further reduction from March. The total CVOC concentration in MW-166 at the southern edge of the TA and in the area of potential plume diversion decreased to 147 µg/L from 183 µg/L in March. Total CVOC concentrations at MW-247 decreased to 10.8 µg/L in September.

3.4 PLUME MAPS

Total CVOC concentrations for the March-April and September sample events are shown on [Figures 8](#) and [9](#). The March-April results include wells sampled for both the LTM and performance monitoring

events; only PMWs were sampled in September. The total CVOC concentrations demonstrate continued reduction in the Off Depot plume due to the Source Areas and Off Depot RAs. The 50 µg/L contour for total CVOCs provides a quick indication of the progress in meeting the active treatment goal of individual CVOC concentrations below 50 µg/L. Only a few wells in the vicinity of the AS/SVE treatment system have total CVOC concentrations well above 50 µg/L, and total CVOC concentrations decreased from March to September 2011. The 50 µg/L isopleth on [Figure 9](#) indicates potential CVOC migration to the south based on the increased concentration in MW-249; however, the concentration is low (37.8 µg/L) and LTM wells are located further south to monitor continued migration.

Concentrations and isopleths for the primary CVOCs detected most frequently (TeCA, PCE, TCE, DCE, cDCE, CT and CF are shown on [Figures 10 to 16](#), respectively. Each figure includes a 50 µg/L isopleth to show where the the active treatment objective has not been met and an isopleth at both the TC and MCL, where applicable, to show where that RAO has not been met. TeCA ([Figure 10](#)) and TCE ([Figure 12](#)) are the only CVOCs with significant areas above the MCL or TC.

3.5 WELL CLASSIFICATION REVIEW

Currently, 57 wells are included in Off Depot LTM. The current well classifications are shown on [Table 1](#): 9 background wells, 13 sentinel wells and 35 performance wells. Performance monitoring near the AS/SVE system incorporates 36 additional wells; these PMWs will be incorporated in LTM in 2012. Analytical results for the individual well classifications in the 2011 LTM events are summarized in the following sections.

Historical analytical results for the primary CVOCs in the LTM wells and PMWs are provided in [Appendix C](#). Time trend plots for primary CVOCs detected above MCLs or the TC for TeCA in LTM wells and PMWs are provided in [Appendix D](#); where multiple sample results were available for a sampling event, the higher result was plotted.

3.5.1 Background Wells

There are 9 LTM background wells screened in the fluvial aquifer located along or outside of the Dunn Field boundary; upgradient to or at a distance from contaminant plumes on Dunn Field; and with no or low previous detections of primary CVOCs. All background wells were sampled in April 2011. Primary CVOCs were detected above the RL in three wells; CF in MW-13 and MW-178, and DCE, PCE and TCE in MW-51. The DCE and TCE concentrations exceeded their MCLs in MW-51, which is located north of Dunn Field and within the plume originating from an off-site source northeast of Dunn Field.

3.5.2 Sentinel Wells

There are 13 LTM sentinel wells screened within either the fluvial or intermediate aquifers adjacent to or within a window. All sentinel wells were sampled in April 2011. Primary CVOCs were detected above the RL in three wells; DCE in MW-237 and MW-239, and TCE in MW-240. No concentrations were above the MCL.

3.5.3 Performance Wells

There are 35 LTM performance wells screened in the fluvial aquifer and within the limits of groundwater plumes. All performance wells were sampled in April 2011. Primary CVOCs were detected above RLs in 22 performance wells. Concentrations exceeded the MCL for TCE and the TC for TeCA in 4 wells: MW-32, MW-144, MW-184 and MW-190.

3.5.4 PMWs

There are 36 PMWs, 33 screened in the fluvial aquifer and 3 screened in the intermediate aquifer. All PMWs were sampled in March-April and September 2011.

In March-April, primary CVOCs were detected above RLs in 26 of the 33 wells screened in the fluvial aquifer and in 1 of the 3 wells screened in the intermediate aquifer. Concentrations exceeded their MCLs and/or the TC for TeCA in 19 fluvial aquifer wells; additional information is provided in [Table 14](#). Concentrations were not above an MCL or the TC for TeCA in the intermediate aquifer well.

In September, primary CVOCs were detected above RLs in 25 of the 33 wells screened in the fluvial aquifer and in 1 of the 3 wells screened in the intermediate aquifer. Concentrations exceeded their MCLs and/or the TC for TeCA in 16 fluvial aquifer wells; additional information is provided in [Table 16](#). Concentrations in four of the fluvial aquifer wells (MW-54, MW-155, MW-157 and MW-242) decreased below the MCLs or TC from March-April to September while the concentration increased above the TC for TeCA in one well (MW-244). Concentrations were not above an MCL or the TC for TeCA in the IAQ well.

3.6 TREND ANALYSIS

Concentration trends were assessed for available groundwater analytical results for LTM wells and PMWs from January 2004 through September 2011 using the Mann-Kendall test. The Mann-Kendall test does not require any assumptions as to the statistical distribution of the data and can be used with data sets which include irregular sampling intervals and missing data. The analysis was performed using the

Mann-Kendall module within the Monitoring and Remediation Optimization System (MAROS) software version 2.2 developed by AFCEE. The Mann-Kendall trend evaluation using MAROS relies on three statistical metrics: the Mann-Kendall statistic (S), the coefficient of variation (COV) and the confidence factor (CF).

S measures the trend in the data. Positive values indicate an increase in constituent concentrations over time, whereas negative values indicate a decrease in constituent concentrations over time. The strength of the trend is proportional to the magnitude of S (i.e., large magnitudes indicate a strong trend).

COV is a statistical measure of how the individual data points vary about the mean value; it is defined as the standard deviation divided by the average. Values less than or near 1.00 indicate that the data form a relatively close group about the mean value. Values larger than 1.00 indicate that the data show a greater degree of scatter about the mean. CF is the statistical probability that the constituent concentration is increasing ($S > 0$) or decreasing ($S < 0$).

The Concentration Trend for each well is determined according to the following rules:

Mann-Kendall Statistic	Confidence in Trend	Concentration Trend
$S > 0$	$> 95\%$	Increasing
$S > 0$	$90 - 95\%$	Probably Increasing
$S > 0$	$< 90\%$	No Trend
$S = 0$	$< 90\% \text{ and } \text{COV} \leq 1$	No Trend
$S = 0$	$< 90\% \text{ and } \text{COV} < 1$	Stable
$S < 0$	$90 - 95\%$	Probably Decreasing
$S < 0$	95%	Decreasing

If there are less than four sample results, the trend evaluation cannot be performed and the trend is listed as Insufficient Data (N/A). If the analyte is below the detection limit for all samples, the trend is listed as Not Detected (ND).

The Mann-Kendall analysis was run for the 93 Off Depot LTM wells and PMWs using analytical results for TeCA, PCE, TCE, DCE, CT and CF, the six CVOCs most commonly detected above TCs in the wells. The results of the Mann-Kendall analysis are shown on [Tables 17 through 22](#). The tables present the statistical metrics for each well, the concentration trend, the number of sample rounds and the number of samples with detects. In addition, the maximum and minimum analytical results for the review period are shown.

The results are summarized below for background wells, sentinel wells, performance wells and PMWs. The Insufficient Data column includes wells with less than four sample analyses or with all analyses below detection limits; non-detect results were the most common reason as shown on [Tables 17 through 22](#). The sentinel wells include the 13 LTM sentinel wells and the 3 PMWs installed in the IAQ.

Background Wells

	Total Locations	Insufficient Data	Increasing/ Probably Increasing	Stable/ No Trend	Decreasing/ Probably Decreasing
TeCA	9	5	0	4	0
PCE	9	1	0	5	3
TCE	9	2	1	2	4
DCE	9	7	0	0	2
CT	9	6	0	3	0
CF	9	3	1	4	1

Sentinel Wells

	Total Locations	Insufficient Data	Increasing/ Probably Increasing	Stable/ No Trend	Decreasing/ Probably Decreasing
TeCA	16	11	0	5	0
PCE	16	11	0	4	1
TCE	16	9	0	5	2
DCE	16	10	0	3	3
CT	16	15	0	1	0
CF	16	8	0	6	2

Performance Wells

	Total Locations	Insufficient Data	Increasing/ Probably Increasing	Stable/ No Trend	Decreasing/ Probably Decreasing
TeCA	35	6	0	13	16
PCE	35	4	1	11	19
TCE	35	2	0	9	24
DCE	35	29	0	5	1
CT	35	13	1	10	11
CF	35	3	1	20	11

PMWs

	Total Locations	Insufficient Data	Increasing/ Probably Increasing	Stable/ No Trend	Decreasing/ Probably Decreasing
TeCA	33	0	5	6	22
PCE	33	2	1	9	21
TCE	33	1	4	4	24
DCE	33	20	2	8	3
CT	33	10	1	5	17
CF	33	1	1	10	21

Few LTM wells or PMWs had increasing/probably increasing trends. The majority of sentinel wells had insufficient data due to few CVOC concentrations above the RL and the majority of background wells had either stable/no trend or insufficient data. LTM performance wells and PMWs showed the most decreasing/probably decreasing trends, due to the Source Areas and Off Depot RAs. Increasing trends were reported at four wells for TeCA (MW-151, MW-165A, MW-166 and MW-166A) and for TCE (MW-151, MW-166, MW-166A and MW-249). All except MW-249 are located near the western end of the AS/SVE system and the trends likely reflect plume diversion around the system. The concentrations are relatively low; concentrations have exceeded 50 µg/L in MW-165 (TeCA at a maximum of 104 µg/L in June 2010), MW-166 (TCE at a maximum of 223 µg/L in September 2010) and MW-166A (TCE at a maximum of 85.9 µg/L in January 2011); the latest concentrations at these three wells have decreased to

less than 50 µg/L except at MW-166 (TCE at 50.2 µg/L). MW-249, which is located south of the AS/SVE system, only increased in the latest sample (TCE at 12.4 µg/L in September 2011).

4.0 CONCLUSIONS AND RECOMMENDATIONS

4.1 CONCLUSIONS

The RAs at Dunn Field have resulted in continued, significant reduction of CVOC concentrations in groundwater, as seen in total CVOC plume maps for April 2007, April 2009, March 2010 and March 2011 shown in [Figure 17](#). The highest total CVOC concentration in the Off Depot monitoring wells has decreased continually from 12,219 µg/L in April 2007 to 311 µg/L in September 2011.

As described in the ROD Amendment, the active Off Depot remedy is to reduce individual CVOC concentrations to 50 µg/L or less. The AS/SVE system in combination with natural attenuation processes is expected to reduce groundwater concentrations to MCLs within a reasonable period of time. Based on the Off Depot treatment goal, individual CVOC concentrations in wells on Dunn Field are not to exceed 50 µg/L after RA unless the groundwater will pass through the Off Depot TA. The AS/SVE system will continue to operate until the influent (upgradient) concentrations from the Dunn Field plume do not exceed 50 µg/L for individual CVOCs.

All of the LTM wells were sampled for the biennial event in April 2011 and none contained individual CVOC concentrations above 50 µg/L. Only four PMWs exceeded 50 µg/L for individual CVOCs in the March-April samples and only three PMWs exceeded the treatment goal in September 2011.

The great majority of LTM wells and PMWs had stable/no trend or decreasing/probably decreasing trends indicating the success of RA on Dunn Field and in off depot groundwater. Increasing trends at a few wells (MW-151, MW-165A, MW-166 and MW-166A) indicate potential plume diversion around the southern end of the AS/SVE, but the concentrations are relatively low and any diversion appears to be limited; changes to AS/SVE system operations are not recommended.

Due to the presence of multiple CVOCs in the plumes within and immediately downgradient of Dunn Field, the Dunn Field ROD established RGs for groundwater based on a target cumulative risk level of 1 in 10,000 (1×10^{-4}) and a Hazard Index of 1.0. The final RGs may vary based on the individual concentration of each CVOC in a compliance well; however, they will not exceed MCL or nonzero MCL goal levels.

All 57 Off Depot LTM wells were sampled in April 2011, and five wells had primary CVOC concentrations above an MCL or the TC for TeCA. Four of the wells (MW-32, MW-144, MW-184 and MW-190) are located west of Dunn Field in the central portion of the Off Depot plume; CVOC

concentrations in all four wells exceeded the MCL for TCE (6.92 µg/L to 43.2 µg/L) and the TC for TeCA (2.36 µg/L to 24.1 µg/L). The fifth well (MW-51) is located north of Dunn Field, within the plume originating from an off-site source northeast of Dunn Field; CVOC concentrations exceeded the MCLs for TCE (8.84 µg/L) and DCE (13.9 µg/L).

All 36 PMWs were sampled in March-April and September 2011. In March-April, an MCL or the TC for TeCA was exceeded for one or more CVOCs in 20 wells: TeCA (18 wells), TCA (1 well), DCE (1 well), CT (1 well), PCE (1 well), TCE (15 wells) and VC (1 well). In September, an MCL or the TC for TeCA was exceeded for one or more CVOCs in 17 wells: TeCA (15 wells), TCA (1 well), DCE (1 well), CT (1 well), PCE (1 well), TCE (13 wells) and VC (1 well). In both sample events, TeCA and/or TCE was one of the exceedances in each well. The highest concentrations reported for each CVOC are shown on [Tables 14 and 16](#).

Concentrations and isopleths for the primary CVOCs shown on [Figures 10 to 16](#) show the extent to which the active treatment objective has been met and where concentration exceed the MCL or TC. As noted in the discussion of analytical results, only TeCA and TCE are found above the cleanup goals in multiple wells; the highest concentrations are in the area immediately upgradient of the AS/SVE TA with the concentrations and area decreasing in each successive sample event.

4.2 LTM RECOMMENDATIONS

Historical results were reviewed for all wells, including the water level only wells, and 27 wells are recommended for abandonment. The wells and rationale for abandonment are listed on [Table 23](#); the locations are shown on [Figure 18](#). The recommendations are based on the following criteria from the Off Depot LTM plan:

1. The MW is redundant: duplicates information; not in the flow pathway of on-coming plumes and not required to establish background; or analytical data will have no clear, reasonable use in future decision making.
2. The MW has sustained damage and cannot be repaired, or an object that cannot be removed has become lodged in the MW.
3. The MW was installed for a specific reason that no longer applies.

The remaining 87 LTM wells were reviewed in accordance with the LTM plan for classification and sample frequency. The PMWs will be incorporated into LTM in 2012 and will be classified as performance wells, except the PMWs screened in the IAQ which will be classified as sentinel wells. The

water level only wells will also be incorporated into LTM with appropriate sample frequencies. The LTM wells for 2012 are listed on [Table 24](#) and the locations are shown on [Figure 18](#).

The well classifications for 2011 included 21 background wells, with 9 wells sampled biennially and 12 wells used for water levels only. Nine background wells are listed on [Table 23](#) for abandonment; the remainder will be assigned a sample frequency. Of these remaining background wells, four wells (MW-08, MW-129, MW-130 and MW-230), located on or bordering the northeast section of Dunn Field, have historically had moderate concentrations (up to 200 µg/L) of PCE, TCE and DCE. These concentrations are attributed to an off-site source(s) upgradient of Dunn Field and unrelated to past operations at DDMT; source investigations have been performed by USEPA and TDEC without definitive results. Because of the elevated CVOC concentrations and the attribution to an upgradient source, these wells will be classified ‘Background-NE’. In addition, MW-07 is recommended to be reclassified from Performance to Background-NE because it is on the northern boundary of Dunn Field near these four wells, has similar concentrations and is upgradient to the identified source areas on Dunn Field.

The 2012 LTM wells are classified as Background (8), Background-NE (5), Performance (51), Performance-FSVE (14) or Sentinel (9) wells. The Performance-FSVE wells are LTM Performance wells selected for rebound monitoring after the FSVE system is shut down.

Each LTM well was reviewed in accordance with the guidelines in the Off Depot LTM plan and the wells were assigned semiannual (42), annual (33) or biennial (12) sample frequencies. The well classification, sample frequency and 2012 sampling events are shown on [Table 25](#). The general guidelines for each classification are listed below.

The background wells will be sampled as follows:

- Wells with results below MCLs in the last four events will be sampled in biennial events: MW-13, MW-154, MW-167, MW-187.
- Wells with results above MCLs in one of the last four events will be sampled in annual events: MW-04, MW-07, MW-129, MW-130, MW-230.
- Well MW-28 has not been sampled since 1996 and will be sampled semiannually in 2012-2013.
- Wells MW-08, MW-80 and MW-126 have not been sampled since 2007 and will be sampled in the 2012 annual event; the frequency will be re-evaluated for 2013.

All the sentinel wells have had results below MCLs for at least the last four events. The wells will be sampled as follows:

- Wells at significant distance from performance wells exceeding MCLs will be sampled in biennial events: MW-67, MW-169, MW-170, MW-171.
- Wells near performance wells exceeding MCLs will be sampled in annual events: MW-182, MW-235, MW-237, MW-250, MW-251.

The performance wells will be sampled as follows:

- Wells with results above MCLs in one or more of the last four events and wells selected for FSVE system rebound monitoring will be sampled in semiannual events.
- Wells with results below MCLs in the last four sample events will be sampled in annual events.
- Wells on the edge of the monitoring network with consistent results below MCLs will be sampled in biennial events: MW-33, MW-58, MW-78, MW-153.

TABLE 23
 WELLS TO BE ABANDONED
 OFF DEPOT ANNUAL GROUNDWATER MONITORING REPORT - 2011
 Dunn Field - Defense Depot Memphis, Tennessee

Well	Aquifer	Well Classification	Rationale
MW-05	Fluvial	Performance	Well is redundant. Sampling at MW-05 was restarted in 2009 and CVOC concentrations are below RLs. Well is near MW-69.
MW-10	Fluvial	Performance	Well is redundant. It does not fully screen the fluvial aquifer and is near MW-03 and MW-220.
MW-14	Fluvial	Background	Well is not located upgradient of TA-4 on Dunn Field; MW-187 provides background data for area.
MW-37	Intermediate	Sentinel	Well was installed to monitor vertical migration of CVOCs in IAQ. No detections above RL since installation in 1993. (Oct07 results believed to be mis-labeled sample.) Low CVOC concentrations in overlying fluvial aquifer.
MW-42	Fluvial	Background	Four wells are located on the west side of the trough in groundwater contours; all have been sampled with no CVOCs reported above RLs. MW-42 and MW-127 will be abandoned; MW-80 and MW-126 will be maintained.
MW-43	Intermediate	Sentinel	Well was installed to monitor vertical migration of CVOCs in IAQ. Only one sample (Feb01) had CVOCs above RL. Well is distant from plume and CVOC concentrations in fluvial aquifer are decreasing.
MW-45	Fluvial	Background	Well is located too east of Dunn Field for reliable background data; well has not been sampled since 1998.
MW-51	Fluvial	Background	Well is located north of Dunn Field and not directly upgradient; MW-129 and MW-130 will provide background data for north end of Dunn Field.
MW-65	Fluvial	Background	Well is located north of Dunn Field and not directly upgradient; MW-129 and MW-130 will provide background data for north end of Dunn Field.
MW-74	Fluvial	Performance	Well is redundant. It is near MW-70 and MW-134 and concentrations are similar.
MW-75	Fluvial	Performance	Well is not necessary. CVOC concentrations are below RLs and have been at low levels since installation in 2001.
MW-127	Fluvial	Background	Four wells are located on the west side of the trough in groundwater contours; all have been sampled with no CVOCs reported above RLs. MW-42 and MW-127 will be abandoned; MW-80 and MW-126 will be maintained.
MW-128	Fluvial	Background	Well is located north of Dunn Field and not directly upgradient; MW-129 and MW-130 provide background data for north end of Dunn Field.
MW-132	Fluvial	Performance	Well is redundant. It is near MW-134 and MW-222; CVOC concentrations are similar.
MW-161	Fluvial	Performance	Well is redundant. It is near MW-190 and CVOC concentrations are similar.
MW-162	Fluvial	Performance	Well is redundant. No CVOCs above MCLs since 2010. Well is near MW-76.
MW-172	Fluvial	Background	Well is located too close to TA-4 for background location; MW-187 provides background data for area.
MW-175	Fluvial	Performance	Well was damaged during thermal SVE treatment and is not usable.
MW-178	Fluvial	Background	Well is located too close to TA-2 for background location; MW-13 provides background data for area.
MW-179	Fluvial	Performance	Well is not necessary. Concentrations are below RLs and have been below MCLs since installation in 2005.
MW-185	Fluvial	Sentinel	Well was installed for RD investigation. Only initial sample in Nov05 had CVOCs above RL. Well is distant from plume and has upgradient sentinel wells (MW-169 and MW-171).
MW-186	Fluvial	Sentinel	Well was installed for RD investigation. Well has had low detections of TCE but upgradient sentinel wells were non-detect.

TABLE 23
WELLS TO BE ABANDONED
OFF DEPOT ANNUAL GROUNDWATER MONITORING REPORT - 2011
Dunn Field - Defense Depot Memphis, Tennessee

Well	Aquifer	Well Classification	Rationale
MW-231	Intermediate	Sentinel	Well was installed for IAQ investigation. No CVOCs above RL since installation in 2008. Low concentrations in overlying fluvial aquifer.
MW-232	Intermediate	Sentinel	Well was installed for IAQ investigation. Initial two samples in Dec07 and Apr08 had CVOCs above MCLs; concentrations have since decreased below RL. Well had very low yield in pump test. Adjacent IAQ wells (MW-237 and MW-251) with consistent analytical results will be maintained.
MW-234	Intermediate	Sentinel	Well was installed for IAQ investigation. No detections above RL since installation in 2008. Low concentration in overlying fluvial aquifer.
MW-239	Intermediate	Sentinel	Well was installed for IAQ investigation. DCE dected above RL in Apr11 sample. Adjacent IAQ well (MW-237) with slightly higher CVOC concentrations will be maintained.
MW-240	Intermediate	Sentinel	Well was installed for IAQ investigation. Well has had low detections of TCE and cDCE but upgradient sentinel wells were non-detect.

Notes:

CVOC: chlorinated volatile organic compound RD: Remedial Design

cDCE: cis-1,2-Dichloroethene

RL: Reporting Limit

DCE: 1,1-dichloroethene

SVE: Soil Vapor Extraction

IAQ: Intermediate Aquifer

TA: Target Area

MAQ: Memphis Aquifer

TCE: trichloroethene

MW: Monitoring Well

APPENDIX B
DATA QUALITY EVALUATION

DATA QUALITY EVALUATION

Off Depot Long-Term Monitoring (LTM) and Performance Monitoring (PM) were conducted by HDR during three sample events in 2011. Wells were selected for sampling in accordance with the *Long-Term Groundwater Monitoring Plan* (LTM Plan) in Appendix C of the *Off Depot Groundwater Final Remedial Design, Rev. 1* (CH2M HILL, 2008) and the *Work Plan for Off Depot Groundwater Sampling* (HDR|e²M, March 2010). Groundwater samples were submitted to Microbac Laboratories in Marietta, Ohio for analysis. The field and laboratory procedures were performed in accordance with the *Remedial Action Sampling and Analysis Plan, Rev. 0* (RA SAP) (MACTEC, 2005).

The data quality evaluation (DQE) process involves assessment of all field and laboratory procedures, including data validation in accordance with the RA SAP completed by Diane Short and Associates, Inc (DSA). The data validation reports are included in this appendix. This assessment is designed to evaluate problems with the quality assurance (QA)/quality control (QC) associated with the laboratory data and potential impact to the data quality objectives (DQOs). The DQE findings are summarized in the following sections.

FIELD ACTIVITIES AND FIELD QUALITY CONTROL

The field effort included the collection of groundwater samples from designated wells during the biennial LTM event in April 2011 and the semiannual PM events in March-April and September 2011. The LTM well locations are shown on Figure 1 and the PM well locations are shown on Figure 2 of the report. Field QC samples were collected at selected wells to evaluate sampling technique and decontamination procedures. These samples included field duplicates, trip blanks, and field equipment (rinsate) blanks. Additional samples were collected at selected locations for matrix spike/matrix spike duplicate (MS/MSD) analyses in the laboratory. Sample bottles met U.S. Environmental Protection Agency (USEPA) requirements for environmentally clean containers. Sample labels were pre-printed to facilitate sample tracking from the field through the laboratory. Documentation of the sampling was performed in the field to ensure that the samples collected, sample labels, chain-of-custody (COC) records, which were generated electronically using a personal digital assistant (PDA) supplied by the laboratory, and request for analysis were consistent. Where necessary, COC forms were filled out manually. Custody seals were placed on each sample cooler prior to shipment by common carrier.

The majority of samples collected in March 2011 for the biennial LTM event and the first semiannual PM event were stored at the laboratory in a refrigerator that lost power; the sample temperatures rose to approximately 18 °C, above the required 6 °C maximum. All of the LTM samples and some of the PM

samples exceeded the maximum storage temperature; all affected samples were re-collected by HDR at the laboratory's expense in April 2011.

ANALYTICAL METHODS

The groundwater samples were analyzed for Target Compound List (TCL) volatile organic compounds (VOCs) by method SW 8260B.

LABORATORY QUALITY CONTROL

The laboratory QC program, including sample handling, laboratory control, and reporting, is documented in the RA SAP. Sample handling includes documentation of sample receipt, placement in storage, lab personnel using the sample, and disposal. The laboratory control consists of instrument calibration and maintenance, laboratory control samples (LCS), method blanks and matrix spikes. Reporting of the laboratory control data was planned prior to the collection of the data, allowing the laboratory to place the appropriate information into the data package so that the DQE could be performed in a timely manner.

DQE SUMMARY

The objective of the DQE was to provide a review of the chemical data reports submitted by the laboratory and to assess the data in relation to the data quality objectives stated in the RA SAP. The DQE consisted of review of laboratory QC data and field QC parameters, and flagging of the data as usable, usable with qualification, or unusable in accordance with the DQE standard operating procedures (SOPs) using the criteria stated in the RA SAP for each analytical method performed. The following information was reviewed:

- Sample Integrity (Deliverables)
- Sample Completeness
- Sample Holding Times
- Laboratory Methods for Extraction and Analysis (Calibration, Internal Standards)
- Method Accuracy (bias) and Precision (Surrogates, Matrix Spike/Matrix Spike Duplicates (MS/MSD), LCS Recoveries)
- Laboratory Performance Criteria (Blanks, Instrument Performance Check)

Field QC parameters were evaluated through field duplicates, rinsate blanks, field documentation, and shipping criteria.

The DQE was summarized by use of flags that indicate to the reviewer that the data being considered has been qualified using the established criteria. Sample delivery group (SDG) narratives detailing the evaluation of the laboratory data by DSA are included as attachments in this Appendix. The SDGs and associated groundwater samples are listed on Table B-1.

The following sections provide summary discussions of the required data qualifications for each sampling event. A Level III DQE was performed and the data quality indicators (DQIs), expressed in terms of precision, accuracy, representativeness, comparability, completeness, and sensitivity, were assessed. This included the evaluation of sample integrity, holding times, trip blanks, rinsate blanks, method blanks, internal standards, surrogate recoveries, matrix spike/matrix spike duplicate (MS/MSD) recoveries, LCSs, and field duplicate precision. The results of the DQI assessment are provided below.

Precision

Field duplicates were collected to assess sampling precision. They consisted of replicate samples collected concurrently with the associated field samples. Precision is best expressed in terms of relative percent difference (RPD). Field precision goals were met for the duplicate sample pairs collected during the three sampling events. Laboratory precision is discussed in more detail in the attached narratives.

Accuracy

Accuracy or bias was measured through the analyses of LCSs and MS/MSDs. Sample specific accuracy is measured through surrogate recovery. Accuracy is expressed as percent recovery (%R).

Although there were a number of low or high LCS recoveries observed in the three events, all associated data are qualified UJ or J and as such are valid. Accuracy goals based upon LCS were met. Further discussion of the LCS and MS/MSD recoveries is provided in the attached DQE narratives.

Representativeness

Representativeness refers to the degree sample data accurately and precisely describes the population of samples at a sampling point or under certain environmental conditions. Samples that are not properly preserved or are analyzed beyond holding times may not be considered representative. Review of sampling procedures, laboratory preparation, analysis holding times, trip blank and rinsate blank analysis help in providing this assessment.

Sampling procedures followed the RA SAP and were considered representative of the matrices collected. Laboratory preparation and analysis followed method guidelines.

Comparability

The selection of standardized methods and consistent laboratory practices facilitates the comparison of data between LTM and PM events. Past LTM and PM data are comparable to recent events. Consistent methodology has been maintained throughout the LTM and PM sampling events.

Completeness

Completeness is determined for both field and analytical objectives. Field completeness is calculated from the number of samples proposed versus the actual number of samples collected. Analytical completeness is expressed in terms of usable data. The project completeness goal for DDMT is 90% as stated in the RA SAP.

Data from the one LTM event in April 2011 and the two PM events in March through April and September 2011 were 100% complete and therefore met the completeness DQO.

Sensitivity

Analytical sensitivity is the concentration at which the measurement system can quantitate target analytes in the environmental matrices of concern. Analytical sensitivity is expressed in terms of the reporting limit (RL), which is provided by the respective laboratories as their reasonable and defensible quantitation limit for environmental samples above the method detection limit (MDL), which is established by each laboratory using pure water or clean matrix. The analytical method RLs and MDLs were compared to groundwater protection standards as listed in the RA QAPP and were determined to meet the overall project objectives. (The MDLs for six VOCs [1,1,2,2-tetrachloroethane, 1,1,2-trichloroethane, 1,2-dichloroethane, bromodichloromethane, carbon tetrachloride, and dibromochloromethane] were above the standards; however, as noted in the QAPP..."MDLs for these VOC ... compounds are higher than their corresponding screening levels because current VOC ... analytical method technology can not achieve MDLs lower than those listed."]

The following sections discuss only those deficiencies encountered during the evaluation that resulted in qualified and/or unusable data.

Biennial LTM Event – April 2011

A total of 73 water samples including 57 groundwater field samples and 16 QA/QC samples (duplicates, MS/MSD, trip blanks, rinsate blanks) were collected from 57 LTM wells in April 2011. The data are usable with qualifications as described below:

- When a high LCS recovery is associated with a non-detect in samples, no qualifier is added since the indicated bias is high. When the analyte is detected, the result is qualified as J and data could be biased high proportional to the LCS %R. All results associated with low recoveries are qualified J. Two samples had a low LCS recovery for bromomethane, carbon disulfide and chloromethane, which were non-detect and qualified UJ. Eight samples had a low LCS recovery for naphthalene, which was non-detect and qualified UJ. Sixteen samples had a low LCS recovery for acetone, which was non-detect and qualified UJ. Four samples had a high LCS recovery for acetone, which was detected and qualified J. The analytes with low or high LCS recoveries were not contaminants of concern and will not impact the use of the data.
- There were detections of 1,4-dichlorobenzene, chloroform and acetone observed below the reporting limits in one rinsate blank. Whenever methylene chloride, acetone or 2-butanone is detected in associated samples at a level less than 10x the method blank (corrected for dilution), the result is qualified as B. The factor is 5x for other analytes. 1,4-Dichlorobenzene in 20 samples, chloroform in 11 samples and acetone in four samples were detected and qualified B. Such results are usable but may be biased high.
- Any result reported below the reporting limit (RL) but above the method detection limit (MDL) was flagged “J” and considered an estimated result (unless overridden by other QC flags).

Semi-Annual PM Event – March-April 2011

A total of 48 water samples including 36 groundwater field samples and 12 QA/QC samples (duplicates, MS/MSD and trip blanks) were collected from 36 PM wells in March and April 2011. The samples were analyzed for TCL VOCs. The data are usable with qualifications as described below:

- Bromomethane and dichlorodifluoromethane were non-detect and qualified as estimated UJ in one sample (MW-70-ODPM-8) based on MS/MSD recovery. Bromomethane and dichlorodifluoromethane are not contaminants of concern and will not impact the use of the data.
- Three samples had a high LCS recovery for acetone, which was detected and qualified J. Four samples had a low LCS recovery for acetone, which was non-detect and qualified UJ. Three samples had a high LCS recovery for acetone, which was detected and qualified J. Acetone is not a contaminant of concern and will not impact the use of the data.
- Any result reported below the reporting limit (RL) but above the method detection limit (MDL) was flagged “J” and considered an estimated result (unless overridden by other QC flags).

Semi-Annual PM Event – September 2011

A total of 47 water samples including 36 groundwater field samples and 11 QA/QC samples (duplicates, MS/MSD, trip blanks and a rinsate blank) were collected from 36 PM wells in September 2011. The samples were analyzed for TCL VOCs. The data are usable with qualifications as described below:

- Twelve samples had a high LCS recovery for acetone, which was detected and qualified J. Acetone is not a contaminant of concern and will not impact the use of the data.
- Any result reported below the reporting limit (RL) but above the method detection limit (MDL) was flagged “J” and considered an estimated result (unless overridden by other QC flags).

SUMMARY

The sample data from the April 2011 Off Depot LTM event and the March-April and September 2011 Off Depot PM events met the data quality objectives and are of sufficient quality to support the evaluation of remedial actions.

DATA REVIEWER: Diane Short

QA REVIEWER: Diane Short & Associates, Inc. INITIALS/DATE: _____ 05/26/2011

Telephone Logs included Yes No X

Contractual Violations Yes No X

The project QAPP (11/05), the EPA Contract Laboratory Program National Functional Guidelines for Organic Review, 1999 and 2001, and the SW-846 Method 8260B have been referenced by the reviewer to perform this data validation review. The EPA qualifiers have been expanded to include a descriptor code and value to define QC violations and their values, per the approval of the Project Manager. Per the Scope of Work, the review of these samples includes Level III validation of all chains of custody, calibrations and QC forms referencing the QC limits in the above documents.

I. DELIVERABLES

A. All deliverables were present as specified in the Statement of Work (SOW), SW-846, or in the project contract.

Yes No _____

This report has been requested to include the following review: QC, hold times, sample integrity (Chains of Custody, sample login), and summary calibrations.

B. Chain of Custody documentation was complete and accurate.

Yes No _____

No qualifiers have been added for Chain of Custody (COC) issues, and the Project Manager will update COC per the following notes to complete the project record.

L11050034: Only page 1 and 4 of 4 of the Chain of Custody documents were signed and dated by the laboratory. These are electronically generated Chain of Custody documents, and there may be electronic signatures which are not currently reviewable. There is no sampler relinquishment signature except on page 4 and the date on page 4 is 4/28/2011 although samples are listed as being collected on 4 28 and 29, 2011. There are sample receipt bar code acknowledgements from the laboratory. However, the hardcopy documents should be properly signed and dated by the laboratory on each page. Only the log in forms contain the courier identification and air bill number.

L11050038: Has a standard chain with acceptable signatures, dates and times. There is no courier or tracking number on the chain, but it is recorded on the laboratory log in forms.

L11040914 is a non-standard chain which has lab receipt tabs on all 3 pages, one field release signature on page 3 with a typed in date and no time. The log-in contains the courier and tracking data.

C. Samples were received at the required temperature, preservation and intact with no bubbles.

Yes No _____

EPA regulations (See Federal Register, March 12, 2007, 40CFR Part 122) require only that the temperature of samples delivered to the laboratory be equal to or less than 6 °C. The sample temperature conditions are fully compliant with applicable regulations.

II. ANALYTICAL REPORT FORMS

A. The Analytical Report or Data Sheets are present and complete for all requested analyses.

Yes No _____

L11050034: The laboratory has run sample result forms together for part of the samples. Samples from different work groups are on the same page; therefore, result forms are not separated as usually done into work group (QC qualification) distinctions.

B. Holding Times

1. The contract holding times were met for all analyses [time of sample receipt to time of analysis (VOA) or time of extraction to time of analysis].

Yes No _____

2. The Clean Water Act (40 CFR 136) or method holding times were met for all analyses (14 days from time of sample collection to analysis or extraction).

Yes No _____

III. INSTRUMENT CALIBRATION – GC/MS

A. Initial Calibration

1. The Response (RF) and Relative Response Factors (RRF) and average RRF for all compounds for all analyses met the contract criteria of > 0.05 or > 0.01 for poor responding volatiles.

Yes No _____ NA _____

Method 8260: Per the Project Manager, the 2001 EPA CLP validation guidance has been applied to the common “poor responders.” Calibration response factors below 0.05 have historically been observed for Acetone, 2-Butanone, and 4-Methyl-2-pentanone. The validation guidance used for this project allows for a response of 0.01 for these compounds if spectral integrity can be verified at low concentrations. These spectra are not commonly provided and are not part of the deliverable for this data set. The laboratory has been tasked with providing to the client verification that the 0.01 RF is valid. If the spectral verification is available, data are not qualified for response factors greater than 0.01 and less than 0.05 for “poor responders.” No data have been qualified.

Most of the low-responding compounds are highly water-soluble and capable of hydrogen bonding with water. This decreases their purge efficiency and results in the relatively low response. The implication of this low purge efficiency is that a relatively low absolute recovery of such compounds is achieved in the purge step of the analysis. If this recovery is consistent, reasonable accuracy and precision can be achieved in a given matrix, which is indicated for the lab matrix by acceptable recoveries in LCS and calibration checks. However, this causes these targets to be more sensitive to matrix variations that impact purge efficiency (such as ionic strength or the presence of varying levels of soluble non-target organic material) than are the more hydrophobic compounds typically analyzed by this method, and as a result they are more likely to exhibit matrix bias.

2a. The relative standard deviation (RSD) for the five point calibration was within the 30% limit for the CCCs.

Yes No _____ NA _____

This is a method requirement and indicates that the analytical system is in control.

2b. The relative standard deviation (RSD) for the five point calibration was within the 30% limit for all other compounds, the average % RSD was < 15%, or a linear curve was used.

Yes No _____ NA _____

The initial calibration information is not provided in summary form for instrument 11. The RSD is noted as being acceptable on the instrument check list and in the narrative and one ‘r’ value is reported. The curves are taken to be acceptable.

3. The 12 hour system Performance Check was performed as required in SW-846.

Yes No _____ NA _____

L11050034: An ICV was reported along with the Initial Calibration. Dichlorodifluoromethane was highWG363: 517 (at 37%, 555 (at 32%) and 630 (at 31.7%). All recoveries were high and this compound is not detected. No qualifier is applied for high recovery for non-detects.

L11040914: An ICV was reported along with the Initial Calibration. Dichlorodifluoromethane was highWG363: 194(at 32.1%, 230 (at 31.7%) and 217 (at 26.2%). All recoveries were high and this compound is not detected. No qualifier is applied for high recovery for non-detects.

B. Continuing Calibrations

1. The midpoint standard was analyzed for each analysis at the required frequency, and the QC criterion of > 0.05 (> 0.01 for CLP 2001 VOA) was met.

Yes No _____ NA _____

2. The percent difference (% D) limits of $\pm 25\%$ were met. The 2001 NFG also allow for 40% D for the “poor responders.” For other compounds, the QAPP notes rejection of detected compounds with % D > 40%.

Yes _____ No NA _____

See the table below. When there are no detections, no qualification is required unless the % D is biased low and so large as to indicate a significant probability of false negatives. Qualification is required for a % D biased high

for detected compounds only. This requires that the RF is acceptable to verify the non-detect status, which is the case here.

Data are qualified "JC#", where # is the % D. There could be variability to the data as there is variability to the response.

The QAPP indicates that compounds in a run should be rejected if the % D is > 40%. We interpret this to mean that non-detects should be rejected and that detected compounds should be "J" qualified, which is the normal validation process for rejection. Professional judgment is that high bias CCVs with a % D greater than 40% should not be rejected for non-detects if the response factors are sufficient to ensure verification of the non-detect. Non-detects with % D values > 40% are qualified "RC#", where # is the % D.

The table below shows the outliers observed in CCVs for this report.

SDG	Batch	Analyte	% D	Bias	Qualifier
L11050034	WG363731	Bromomethane	36	high	None, ND
	WG363517	Acetone	45.7	High	JC46 detects
L11040914	WG36194	Bromomethane	49.8	high	None, ND
	WG363217	Bromomethane	28.5	Low	None ND and RF ok

IV. GC/MS INSTRUMENT PERFORMANCE CHECK

The BFB (VOA) performance check was injected once at the beginning of each 12-hour period and relative abundance criteria for the ions were met.

Yes No _____ NA _____

V. INTERNAL STANDARDS

The Internal Standards met the 100% upper and -50% lower limits criteria, and the Retention times were within the required windows.

Yes No _____ NA _____

VI. SURROGATE STANDARDS

Surrogate spikes were analyzed with every sample.

Yes No _____

And met the recovery limits defined in the QAPP of 70 – 130% for VOA water or 75 – 125% for soil samples.

Yes No _____

VII. MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A. Matrix Spike (MS) and Matrix Spike Duplicate (MSD) were analyzed for every analysis performed and for every 20 samples or for every matrix whichever is more frequent.

Yes No _____

L11050034: There are three MS/MSD samples associated with the 32 (24 field and 8 QC) client samples. This meets the recommendation of 1 per 20 field samples. As this is an ongoing project an overall adherence to the 1:20 frequency is monitored by the Project Manager.

MS/MSD samples are MW: 172, 29 and 39 ODLB-3.

L11040914: There are no MS/MSD samples associated with the 30 (27 field, 3 QC) client samples. No sample was designated and no extra volume was collected. Insufficient volume is noted by the laboratory. There were _____

Sufficient MS/MSDs in the L11050034 set to meet the project frequency for non-field QC samples in this event.

B. The MS and MSD percent recoveries were within the limits defined in the QAPP of VOA at 70 – 130% with five compounds allowed to be within 60 – 140%.

Yes No NA

The full target list has been spiked.

C. The MSD relative percent differences (RPD) were within the defined contract limits for VOA of 30% water or 40% soil, with five compounds allowed to be > 40% RPD.

Yes No NA

Qualifiers are added only when the MS or MSD recovery is also out of limits. Data are qualified “JD#”, where # is the RPD. As the RPD increases, the matrix precision decreases.

D. The MS/MSD were client samples.

Yes No NA

Non-client samples were used in 7 of the workgroups or an LCS/LCSD pair was reported. This meets the method criteria and the project frequency was noted above as being met.

VIII. LABORATORY CONTROL SAMPLE

A. Laboratory Control Sample (LCS) was analyzed for every analysis performed and for every 20 samples.

Yes No

When there are no client samples run for the MS/MSD and LCS/LCSD pair is run in most cases.

B. The LCS percent recoveries were within the limits defined in the QAPP for VOA of 80 – 120% for water or 75 – 125% for soil. Five compounds are allowed to be 60 – 140%. If an LCS and LCSD are analyzed, both samples must have the same compounds out for data to be qualified.

Yes No

The full target list has been spiked. When a high LCS recovery is associated with a non-detect in samples, no qualifier is added since the indicated bias is high. When the target is detected, data are qualified “JL#”, where # is the recovery. Data could be biased high proportional to the LCS percent recovery. All results associated with low recoveries are qualified and data could be biased low.

The table below shows the outliers and the limits applied per the QAPP. The limits are specified based on the matrix.

SDG	Batch	Analyte	% Recovery	Bias	Qualifier
L11050034	WG363517	2,2-dichloropropane	121/110	high	None, ND
L11050034	WG363517	Acetone	65/67.1	Low	JL65 all results in WG
L11050034	WG363517	Dichlorodifluoromethane	134/123	High	None, ND
L11050034	WG36517	Trichlorodifluoromethane	123/112	High	None, ND
L11050034	WG363517	Vinyl chloride	122/112	High	None, ND
L11050034	WG363555	Dichlorodifluoromethane	127/124	high	None, ND
L11050034	WG363630	Dichlorodifluoromethane	132	high	J detects
L11050034	WG363630	Naphthalene	79.3	Low	JL79
L11050034	WG363627	Acetone	68.3	Low	JL68 all results in WG
L11050034	WG363627	Dichlorodifluoromethane	12	High	None, ND
L11040914	WG363230	Dichlorodifluoromethane	140/143	High	None, ND

IX. BLANKS

A. Method Blanks were analyzed at the required frequency and for each matrix and analysis.

Yes No

B. No blank contamination was found in the Method Blank.

Yes No

In WG363230, methylene chloride was detected at 0.25 ug/L. There were no detections of the compound and no qualification is applied.

C. If Field Blanks were identified, no blank contamination was found.

Yes No NA

When analytes are present in both the Field Blank and the associated samples, the results in the samples are qualified in the same manner as for Method Blanks. For clarity, the qualifiers used in this case are “UTB#” for Trip Blanks or “UFB#” for Rinse Blanks, where # is the associated blank value.

L11050034: The trip blanks 3 and 2 were non-detect. The sample LTM-RB1-ODLB-3 appears to be a rinse blank and it was reported with the following detections:

L11040914: the trip blank was clean.

Compound	Result ug/L	Qualifier
1,4-dichlorobenzene	0.837	URB.837 detects less than 5 x blank
Acetone	2.63	URB2.63, detects less than 10 x blank
Chloroform	0.875	URB.875, detects less than 5 x blank

X. FIELD QC

If Field Duplicates were identified, they met guidance for VOA of RPD of < 30% for water or < 50% for soil. For values reported at < 5 × the reporting limit (RL), a difference of 2 × RL or 3.5 × RL for soil is used as guidance. This is referred to as the CRDL Rule. Data are not qualified for Field Duplicates as these are evaluated for the total project by the Project Manager.

Yes No NA

There are six identified field duplicates as described in the following table. If data were qualified they would be J, FD#, where # is the difference between the two values as both values are less than 5 x RL. All results were comparable and no qualification is required.

Parent Sample	Field Dup	Observations	
L11050034	MW-04-ODLB-3	DUP-1-ODLB-3	OK
	MW-171-ODLB-3	DUP-4-ODLB-3	OK
	MW-185-ODLB-3	DUP5-ODLB-3	OK
	MW-228-ODLB-3	DUP-6-ODLB-3	OK
L11040914	MW-044-ODLB-3	DUP-2-ODLB-3	OK
	MW-176-ODLB-3	DUP-3-ODLB3	OK

XI. SYSTEM PERFORMANCE

A. The RICs, chromatograms, tunes and general system performance were acceptable for all instruments and analytical systems.

Yes ____ No ____ NA X ____

Not part of this review level.

B. The suggested EQLs for the sample matrices in this set were met.

Yes X ____ No ____ NA ____

XII. TCL COMPOUNDS

A. The identification is accurate and all retention times, library spectra and reconstructed ion chromatograms (RIC) were evaluated for all detected compounds.

Yes ____ No ____ NA X ____

Not part of this review level.

B. Quantitation was checked to determine the accuracy of calculations for representative compounds in each internal standards quantitation set.

Yes ____ No ____ NA X ____

Not part of this review level.

XIII. TENTATIVELY IDENTIFIED COMPOUNDS

TICs were properly identified and met the library identification criteria.

Yes ____ No ____ NA X ____

Not part of this review level.

XIV. OVERALL ASSESSMENT OF THE CASE

The laboratory has complied with the requested method. Data are fully usable after consideration of qualifiers. The following is noted:

Chain of Custody

No qualifiers have been added for Chain of Custody issues, and the Project Manager will update documentation per the following notes to complete the project record as noted in the text.

Sample Preservation

EPA regulations (See Federal Register, March 12, 2007, 40CFR Part 122) require only that the temperature of samples delivered to the laboratory be equal to or less than 6 °C. The sample temperature conditions are fully compliant with applicable regulations.

Initial and Continuing Calibrations

The initial calibration information is not provided in summary form for instrument 11. The RSD is noted as being acceptable on the instrument check list and in the narrative and one 'r' value is reported. The curves are taken to be acceptable.

L11050034: An ICV was reported along with the Initial Calibration. Dichlorodifluoromethane was highWG363: 517 (at 37%, 555 (at 32%) and 630 (at 31.7%). All recoveries were high and this compound is not detected. No qualifier is applied for high recovery for non-detects.

L11040914: An ICV was reported along with the Initial Calibration. Dichlorodifluoromethane was highWG363: 194(at 32.1%, 230 (at 31.7%) and 217 (at 26.2%). All recoveries were high and this compound is not detected. No qualifier is applied for high recovery for non-detects.

See the table in the text. When there are no detections, no qualification is required unless the % D is biased low and so large as to indicate a significant probability of false negatives. Qualification is required for a % D biased

high for detected compounds only. This requires that the RF is acceptable to verify the non-detect status, which is the case here.

Only data for acetone in one batch are qualified “JC#”, where # is the % D. There could be variability to the data as there is variability to the response.

The QAPP indicates that compounds in a run should be rejected if the % D is > 40%. We interpret this to mean that non-detects should be rejected and that detected compounds should be “J” qualified, which is the normal validation process for rejection. Professional judgment is that high bias CCVs with a % D greater than 40% should not be rejected for non-detects if the response factors are sufficient to ensure verification of the non-detect. Non-detects with % D values > 40% are qualified “RC#”, where # is the % D.

Matrix Spikes

L11050034: There are three MS/MSD samples associated with the 32 client samples. All were within acceptance limits. This meets the recommendation of 1 per 20 field samples. As this is an ongoing project an overall adherence to the 1:20 frequency is monitored by the Project Manager.

MS/MSD samples are MW: 172, 29 and 39 ODLB-3.

L11040914: There are no MS/MSD samples associated with the 30 (27 field, 3 QC) client samples. No sample was designated and no extra volume was collected. Insufficient volume is noted by the laboratory.

There were

Sufficient MS/MSDs in the L11050034 set to meet the project frequency for non-field QC samples in this event.

Laboratory Control Samples

See the table within the body of this report. When a high LCS recovery is associated with a non-detect in samples, no qualifier is added since the indicated bias is high. When the target is detected, data are qualified “JL#”, where # is the recovery. Data could be biased high proportional to the LCS percent recovery. All results associated with low recoveries are qualified and data could be biased low. Data for acetone in 2 batches were low and naphthalene in one batch was slightly low.

Method Blanks

In WG363230, methylene chloride was detected at 0.25 ug/L. There were no detections of the compound and no qualification is applied.

Field Blanks

When analytes are present in both the Field Blank and the associated samples, the results in the samples are qualified in the same manner as for Method Blanks. For clarity, the qualifiers used in this case are “UTB#” for Trip Blanks or “URB#” for Rinse Blanks, where # is the associated blank value.

L11050034: The trip blanks 3 and 2 were non-detect. The sample LTM-RB1-ODLB-3 appears to be a rinse blank and it was reported with the following detections:

L11040914: The trip blank was clean.

Compound	Result ug/L	Qualifier
1,4-dichlorobenzene	0.837	URB.837 detects less than 5 x blank
Acetone	2.63	URB2.63, detects less than 10 x blank
Chloroform	0.875	URB.875, detects less than 5 x blank

Field QC

There are six identified field duplicates as described in the following table. If data were qualified they would be J, FD#, where # is the difference between the two values as both values are less than 5 x RL. All results were comparable and no qualification is required.

SDG and Parent Sample		Field Dup	Observations

Final Data Qualification and Usability Report

Project: Defense Depot Memphis, TN (DDMT)
Off-Depot PM/LTM
Sampling Event: ODLB-3
Project / Task Number: 121842-003
Sample Data Package(s): L11040914, L11050034, L11050038
Data Validation Performed by: Diane Short & Associates (DSA)
Final Data Qualification and Usability
Report Prepared by: Lynn K. Lutz, HDR Inc.

Data Validation Report Review and Comments

The data validation report was acceptable. The report noted 62 samples, but there were 63 samples; the validator miscounted. The validator had all sample results available for validation.

Final Data Qualifiers

Final qualifiers for detected acetone results with LCS recoveries above control limits were J where DSA had qualified as JL122. Final qualifiers for undetected results for acetone, bromomethane, carbon disulfide, chloromethane and naphthalene with LCS recoveries below control limits were UJ where DSA had qualified as JL67, JL68, JL58, JL79.2, JL78.2 or JL79.

Final qualifier for a detected acetone result with a CCV %D of 46% and an LCS recovery below control limits was J where DSA had qualified as JC46L67.

Final qualifiers for detected acetone, chloroform and 1,4-dichlorobenzene results with detections in the equipment rinsate blank were B where DSA had qualified as URB2.63, URB.875 or URB.837.

Final qualifiers were J where detected results were between the MDL and RL.

Data Usability

There were no rejected sample results. All results are usable as qualified.

09 January 2012

ORGANIC DATA QUALITY REVIEW REPORT
Volatile Organics by SW-846 Method 8260B (GC/MS)

SDG	L11030971, L11040913	
PROJECT	Memphis Defense Depot, ODPM-8 Sampling for HDR, Denver	
LABORATORY	Microbac Laboratories, Inc., Marietta, OH	
SAMPLE MATRIX	Water	SAMPLING DATE 03, 04/2011
NUMBER OF SAMPLES	42, including 5 field duplicates	
ANALYSES REQUESTED	SW-846 8260B (VOA by GC/MS)	
SAMPLE NUMBER	See result forms attached and associated EDD	

DATA REVIEWER: Becky Nichols, Diane Short

QA REVIEWER: Diane Short & Associates, Inc. INITIALS/DATE: _____ 06/02/2011

Telephone Logs included Yes No X

Contractual Violations Yes No X

The project QAPP (11/05), the EPA Contract Laboratory Program National Functional Guidelines for Organic Review, 1999 and 2001, and the SW-846 Method 8260B have been referenced by the reviewer to perform this data validation review. The EPA qualifiers have been expanded to include a descriptor code and value to define QC violations and their values, per the approval of the Project Manager. Per the Scope of Work, the review of these samples includes Level III validation of all chains of custody, calibrations and QC forms referencing the QC limits in the above documents.

I. DELIVERABLES

A. All deliverables were present as specified in the Statement of Work (SOW), SW-846, or in the project contract.

Yes No _____

This report has been requested to include the following review: QC, hold times, sample integrity (Chains of Custody, sample login), and summary calibrations.

B. Chain of Custody documentation was complete and accurate.

Yes No _____

No qualifiers have been added for Chain of Custody (COC) issues, and the Project Manager will update COC per the following notes to complete the project record.

L11030971: Only the first page of the Chain of Custody documents were signed and dated by the laboratory.

L11040913: The laboratory has signed and affixed a receipt label on both pages. Only page 2 has a date of collection and a sampler signature. There is no formal relinquishment date or time.

These are electronically generated Chain of Custody documents, and there may be electronic signatures which are not currently reviewable. In addition, there are sample receipt acknowledgements from the laboratory.

However, the hardcopy documents should be properly signed and dated by the laboratory on each page. The log in forms contain the courier identification and air bill number.

C. Samples were received at the required temperature, preservation and intact with no bubbles.

Yes No _____

EPA regulations (See Federal Register, March 12, 2007, 40CFR Part 122) require only that the temperature of samples delivered to the laboratory be equal to or less than 6 °C. The sample temperature conditions are fully compliant with applicable regulations.

L11030971: Per the laboratory, samples 38, 39, 40, 41, 42, 43, 44 and 45 were stored in a refrigerator that experienced a temperature violation during the weekend. The client was notified, and the samples are being repeated, therefore these results were not reviewed.

L11040913: This data set contains the noted re-sampled data.

II. ANALYTICAL REPORT FORMS

A. The Analytical Report or Data Sheets are present and complete for all requested analyses.

Yes No _____

B. Holding Times

1. The contract holding times were met for all analyses [time of sample receipt to time of analysis (VOA) or time of extraction to time of analysis].

Yes No _____

2. The Clean Water Act (40 CFR 136) or method holding times were met for all analyses (14 days from time of sample collection to analysis or extraction).

Yes No _____

III. INSTRUMENT CALIBRATION – GC/MS

A. Initial Calibration

1. The Response (RF) and Relative Response Factors (RRF) and average RRF for all compounds for all analyses met the contract criteria of > 0.05 or > 0.01 for poor responding volatiles.

Yes No _____ NA _____

Method 8260: Per the Project Manager, the 2001 EPA CLP validation guidance has been applied to the common “poor responders.” Calibration response factors below 0.05 have historically been observed for Acetone, 2-Butanone, and 4-Methyl-2-pentanone. The validation guidance used for this project allows for a

response of 0.01 for these compounds if spectral integrity can be verified at low concentrations. These spectra are not commonly provided and are not part of the deliverable for this data set. The laboratory has been tasked with providing to the client verification that the 0.01 RF is valid. If the spectral verification is available, data are not qualified for response factors greater than 0.01 and less than 0.05 for “poor responders.” No data have been qualified.

Most of the low-responding compounds are highly water-soluble and capable of hydrogen bonding with water. This decreases their purge efficiency and results in the relatively low response. The implication of this low purge efficiency is that a relatively low absolute recovery of such compounds is achieved in the purge step of the analysis. If this recovery is consistent, reasonable accuracy and precision can be achieved in a given matrix, which is indicated for the lab matrix by acceptable recoveries in LCS and calibration checks. However, this causes these targets to be more sensitive to matrix variations that impact purge efficiency (such as ionic strength or the presence of varying levels of soluble non-target organic material) than are the more hydrophobic compounds typically analyzed by this method, and as a result they are more likely to exhibit matrix bias.

2a. The relative standard deviation (RSD) for the five point calibration was within the 30% limit for the CCCs.
Yes No _____ NA _____

This is a method requirement and indicates that the analytical system is in control.

L11030971: Instrument 8 (3/28/11) did not contain any summary data for the %RSD or RFs. The RFs were derived from the full standard print out and from the ICV. There were correlation coefficients which are assumed to be for % RSD > 15%. The narrative and Calibration check lists do not note any outliers and no further action is taken.

L11040913: Instrument 6 (4/18/11) did not contain any summary data for the %RSD or RFs. The RFs were derived from the full standard print out and from the ICV. There were correlation coefficients which are assumed to be for % RSD > 15%. The narrative and Calibration check lists do not note any outliers and no further action is taken.

2b. The relative standard deviation (RSD) for the five point calibration was within the 30% limit for all other compounds, the average % RSD was < 15%, or a linear curve was used.

Yes No _____ NA _____

L11030971: See note above

L11040913: See note above.

3. The 12 hour system Performance Check was performed as required in SW-846 and met the QC limits of 70 – 130%.

Yes _____ No NA _____

L11040913: WG363194 reported dichlorodifluoromethane at +32.1%; WG 363194 at 37.6% and WG 363318 at 31.7%. All were high bias. No detects are reported and no qualifier is required.

B. Continuing Calibrations

1. The midpoint standard was analyzed for each analysis at the required frequency, and the QC criterion of > 0.05 (> 0.01 for CLP 2001 VOA) was met.

Yes No _____ NA _____

2. The percent difference (% D) limits of $\pm 25\%$ were met. The 2001 NFG also allow for 40% D for the “poor responders.” For other compounds, the QAPP notes rejection of detected compounds with % D > 40%.

Yes _____ No NA _____

See the table below. When there are no detections, no qualification is required unless the % D is biased low and so large as to indicate a significant probability of false negatives. Qualification is required for a % D biased high for detected compounds only. This requires that the RF is acceptable to verify the non-detect status, which is the case here.

Data are qualified "JC#", where # is the % D. There could be variability to the data as there is variability to the response.

The QAPP indicates that compounds in a run should be rejected if the % D is > 40%. We interpret this to mean that non-detects should be rejected and that detected compounds should be "J" qualified, which is the normal validation process for rejection. Professional judgment is that high bias CCVs with a % D greater than 40% should not be rejected for non-detects if the response factors are sufficient to ensure verification of the non-detect. Non-detects with % D values > 40% (low bias) are qualified "RC#", where # is the % D.

The table below shows the outliers observed in CCVs for this report.

SDG	Batch	Analyte	% D	Bias	Qualifier
L11030971	WG360640	Bromomethane	33.5	high	None, ND
L11040913	WG363194	Bromomethane	49.8	High	None, ND
	WG363211	Acetone	53.8	High	None, ND

IV. GC/MS INSTRUMENT PERFORMANCE CHECK

The BFB (VOA) performance check was injected once at the beginning of each 12-hour period and relative abundance criteria for the ions were met.

Yes No _____ NA _____

V. INTERNAL STANDARDS

The Internal Standards met the 100% upper and -50% lower limits criteria, and the Retention times were within the required windows.

Yes No _____ NA _____

VI. SURROGATE STANDARDS

Surrogate spikes were analyzed with every sample.

Yes No _____

And met the recovery limits defined in the QAPP of 70 – 130% for VOA water or 75 – 125% for soil samples.

Yes No _____

VII. MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A. Matrix Spike (MS) and Matrix Spike Duplicate (MSD) were analyzed for every analysis performed and for every 20 samples or for every matrix whichever is more frequent.

Yes No _____

There are five MS/MSD samples associated with the 42 non-QC client samples. This meets the recommendation of 1 per 20 field samples. As this is an ongoing project an overall adherence to the 1:20 frequency is monitored by the Project Manager.

B. The MS and MSD percent recoveries were within the limits defined in the QAPP of VOA at 70 – 130% with five compounds allowed to be within 60 – 140%.

Yes _____ No NA _____

The full target list has been spiked.

L11040913: For MW-70-ODPM-8, bromomethane was reported at 58.7 and 70.8%; dichlorodifluoromethane at 66 and 70.4%. Data have been qualified JMS#, where # is the lowest recovery. Data could be biased low proportional to the recovery.

C. The MSD relative percent differences (RPD) were within the defined contract limits for VOA of 30% water or 40% soil, with five compounds allowed to be > 40% RPD.

Yes X No _____ NA _____

Qualifiers are added only when the MS or MSD recovery is also out of limits. Data are qualified "JD#", where # is the RPD. As the RPD increases, the matrix precision decreases.

D. The MS/MSD were client samples.

Yes X No _____ NA _____

VIII. LABORATORY CONTROL SAMPLE

A. Laboratory Control Sample (LCS) was analyzed for every analysis performed and for every 20 samples.

Yes X No _____

B. The LCS percent recoveries were within the limits defined in the QAPP for VOA of 80 – 120% for water or 75 – 125% for soil. Five compounds are allowed to be 60 – 140%. If an LCS and LCSD are analyzed, both samples must have the same compounds out for data to be qualified.

Yes _____ No X _____

The full target list has been spiked. When a high LCS recovery is associated with a non-detect in samples, no qualifier is added since the indicated bias is high. When the target is detected, data are qualified "JL#", where # is the recovery. Data could be biased high proportional to the LCS percent recovery. All results associated with low recoveries are qualified and data could be biased low.

The table below shows the outliers and the limits applied per the QAPP. The limits are specified based on the matrix. Per the allowance for 5 compounds to be out, all qualifiers could be removed.

SDG	Batch	Analyte	% Recovery	Bias	Qualifier
L11030971	WG360640	Bromomethane	123	high	None, ND
L11040913	WG363211	Dichlorodifluoromethane	133	High	None, ND
	WG363211	Acetone	71.5	low	JL71.5
L11040913	WG363318	Chloroethane	121/122	High	None, ND
	WG363318	Acetone	122/121	High	JL122 detects
	WG363318	Dichlorodifluoromethane	143/ 145	High	None, ND

IX. BLANKS

A. Method Blanks were analyzed at the required frequency and for each matrix and analysis.

Yes X No _____

B. No blank contamination was found in the Method Blank.

Yes _____ No X _____

Methylene chloride was detected in one of the Method Blanks. Whenever Methylene Chloride, Acetone, 2-Butanone are detected in associated samples at a level less than $10 \times$ the Method Blank (corrected for dilution), data are qualified "UMB#", where # is the corrected Method Blank level. Results are usable as non-detect.

SDG	Batch	Analyte	Concentration	Qualifier
L11030971	WG360650	Methylene Chloride	2.71	None, ND

C. If Field Blanks were identified, no blank contamination was found.

Yes _____ No _____ NA X _____

When analytes are present in both the Field Blank and the associated samples, the results in the samples are qualified in the same manner as for Method Blanks. For clarity, the qualifiers used in this case are "UTB#" for Trip Blanks or "UFB#" for Rinse Blanks, where # is the associated blank value.

X. FIELD QC

If Field Duplicates were identified, they met guidance for VOA of RPD of < 30% for water or < 50% for soil. For values reported at $< 5 \times$ the reporting limit (RL), a difference of $2 \times RL$ or $3.5 \times RL$ for soil is used as guidance. This is referred to as the CRDL Rule. Data are not qualified for Field Duplicates as these are evaluated for the total project by the Project Manager.

Yes _____ No NA _____

There are five identified field duplicates as described in the following table. If data were qualified they would be J, FD#, where # is the difference between the two values as both values are less than $5 \times RL$.

SDG	Parent Sample	Field Dup	Observations
L11030971	MW-54-ODPM-8	DUP-1-ODPM-8	OK
	MW-155-ODPM-8	DUP-2-ODPM-8	OK
	MW-165-ODPM-8	DUP-3-ODPM-8	Several RPD values were outside the limit. 1,1,2,2-Tetrachloroethane (JFD14) and Trichloroethene (JFD10).
	MW-247-ODPM-8	DUP-4-ODPM-8	One RPD value was outside the limit, but would not require qualification based on the CRDL Rule.
L11040913	MW-54-ODPM-8	DUP-1-ODPM-8	OK

XI. SYSTEM PERFORMANCE

A. The RICs, chromatograms, tunes and general system performance were acceptable for all instruments and analytical systems.

Yes _____ No _____ NA _____

Not part of this review level.

B. The suggested EQLs for the sample matrices in this set were met.

Yes No _____ NA _____

XII. TCL COMPOUNDS

A. The identification is accurate and all retention times, library spectra and reconstructed ion chromatograms (RIC) were evaluated for all detected compounds.

Yes _____ No _____ NA _____

Not part of this review level.

B. Quantitation was checked to determine the accuracy of calculations for representative compounds in each internal standards quantitation set.

Yes _____ No _____ NA _____

Not part of this review level.

XIII. TENTATIVELY IDENTIFIED COMPOUNDS

TICs were properly identified and met the library identification criteria.

Yes _____ No _____ NA _____

Not part of this review level.

XIV. OVERALL ASSESSMENT OF THE CASE

The laboratory has complied with the requested method. Data are fully usable after consideration of qualifiers. The following is noted:

Chain of Custody

No qualifiers have been added for Chain of Custody issues, and the Project Manager will update documentation per the notes in the text to complete the project record.

Sample Preservation

EPA regulations (See Federal Register, March 12, 2007, 40CFR Part 122) require only that the temperature of samples delivered to the laboratory be equal to or less than 6 °C. The sample temperature conditions are fully compliant with applicable regulations.

L11030971: Per the laboratory, samples 38, 39, 40, 41, 42, 43, 44 and 45 were stored in a refrigerator that experienced a temperature violation during the weekend. The client was notified, and the samples are being repeated, therefore these results were not reviewed.

L11040913: This data set contains the noted re-sampled data.

Initial Calibrations

L11030971: Instrument 8 (3/28/11) did not contain any summary data for the %RSD or RFs. The RFs were derived from the full standard print out and from the ICV. There were correlation coefficients which are assumed to be for % RSD > 15%. The narrative and Calibration check lists do not note any outliers and no further action is taken.

L11040913: Instrument 6 (4/18/11) did not contain any summary data for the %RSD or RFs. The RFs were derived from the full standard print out and from the ICV. There were correlation coefficients which are assumed to be for % RSD > 15%. The narrative and Calibration check lists do not note any outliers and no further action is taken.

ICV

L11040913: WG363194 reported dichlorodifluoromethane at +32.1%; WG 363194 at 37.6% and WG 363318 at 31.7%. All were high bias. No detects are reported and no qualifier is required.

Continuing Calibrations

See the table within the body of this report. No data have been qualified as all %D recoveries are high and data are non-detect. No qualification is required for high bias when the response factor is acceptable to verify the non-detect as is the case here.

Matrix Spikes

There are five MS/MSD samples associated with the 42 non-QC client samples.

L11040913: For MW-70-ODPM-8, bromomethane was reported at 58.7 and 70.8%; dichlorodifluoromethane at 66 and 70.4%. Data have been qualified JMS#, where # is the lowest recovery. Data could be biased low proportional to the recovery.

Laboratory Control Samples

See the table within the body of this report. When a high LCS recovery is associated with a non-detect in samples, no qualifier is added since the indicated bias is high. When the target is detected, data are qualified "JL#", where # is the recovery. Data could be biased high proportional to the LCS percent recovery. All results associated with low recoveries are qualified and data could be biased low.

Data for acetone have been qualified in 2 work groups.

Method Blanks

See the table within the body of this report. Methylene chloride was detected in one of the Method Blanks.

Whenever Methylene Chloride, Acetone, 2-Butanone are detected in associated samples at a level less than $10 \times$ the Method Blank (corrected for dilution), data are qualified "UMB#", where # is the corrected Method Blank level. Results are usable as non-detect.

Field QC

There are five identified Field Duplicates. See the table within the body of this report. If data were qualified they would be J, FD#, where # is the difference between the two values.

SDG	Parent Sample	Field Dup	Observations
L11030971	MW-54-ODPM-8	DUP-1-ODPM-8	OK
	MW-155-ODPM-8	DUP-2-ODPM-8	OK
	MW-165-ODPM-8	DUP-3-ODPM-8	Several RPD values were outside the limit. 1,1,2,2-Tetrachloroethane (JFD14) and Trichloroethene (JFD10).
	MW-247-ODPM-8	DUP-4-ODPM-8	One RPD value was outside the limit, but would not require qualification based on the CRDL Rule.
L11040913	MW-54-ODPM-8	DUP-1-ODPM-8	OK

TABLE OF QUALIFIED DATA

Lab ID	Client ID	Compound	Result ug/L	MDL	Qualifier
L11040913-03	MW-250-ODPM-8	Acetone	19.9	2.5	JL122
L11040913-04	MW-251-ODPM-8	Acetone	17.7	2.5	JL122
L11040913-05	MW-54-ODPM-8	Acetone	19.4	2.5	JL122
L11040913-06	MW-70-ODPM-8	Acetone	U	2.5	JL71.5
L11040913-06	MW-70-ODPM-8	Bromomethane	U	0.5	JMS58.7
L11040913-06	MW-70-ODPM-8	Dichlorodifluoromethane	U	0.25	JMS66
L11040913-09	MW-76-ODPM-8	Acetone	U	2.5	JL71.5
L11040913-10	MW-77-ODPM-8	Acetone	U	2.5	JL71.5
L11040913-11	MW-79-ODPM-8	Acetone	U	2.5	JL71.5

Final Data Qualification and Usability Report

Project: Defense Depot Memphis, TN (DDMT)
Off-Depot PM/LTM
Sampling Event: ODPM-8
Project / Task Number: 121842-003
Sample Data Package(s): L11030971, L11040913
Data Validation Performed by: Diane Short & Associates (DSA)
Final Data Qualification and Usability
Report Prepared by: Lynn K. Lutz, HDR Inc.

Data Validation Report Review and Comments

The data validation report was acceptable. The report noted there were 42 samples including five field duplicates, but there were 42 samples including five field duplicates and one trip blank; the validator miscounted. The validator had all sample results available for validation.

Final Data Qualifiers

Final qualifiers for detected acetone results with LCS recoveries above control limits were J where DSA had qualified as JL122. Final qualifiers for undetected acetone results with LCS recoveries below control limits were UJ where DSA had qualified as JL71.5.

Final qualifiers for undetected bromomethane and dichlorodifluoromethane results with MS/MSD recoveries below control limits were UJ where DSA had qualified as JMS58.7 or JMS66.

Final qualifiers were J where detected results were between the MDL and RL.

Data Usability

There were no rejected sample results. All results are usable as qualified.

ORGANIC DATA QUALITY REVIEW REPORT
Volatile Organics by SW-846 Method 8260B (GC/MS)

SDG	L11090899	
PROJECT	Memphis Defense Depot, ODPM-9 Sampling for HDR, Denver	
LABORATORY	Microbac Laboratories, Inc., Marietta, OH	
SAMPLE MATRIX	Water	SAMPLING DATE 09/2011
NUMBER OF SAMPLES	47, including 4 field duplicates, 2 trip blanks and 1 rinse blank	
ANALYSES REQUESTED	SW-846 8260B (VOA by GC/MS)	
SAMPLE NUMBER	See result forms attached and associated EDD	

DATA REVIEWER: Diane ShortQA REVIEWER: Diane Short & Associates, Inc. INITIALS/DATE: DLS 10/31/2011 updateTelephone Logs included Yes No XContractual Violations Yes No X

The project QAPP (09/11), the EPA Contract Laboratory Program National Functional Guidelines for Organic Review, 1999 and 2001, and the SW-846 Method 8260B have been referenced by the reviewer to perform this data validation review. The EPA qualifiers have been expanded to include a descriptor code and value to define QC violations and their values, per the approval of the Project Manager. Per the Scope of Work, the review of these samples includes Level III validation of all chains of custody, calibrations and QC forms referencing the QC limits in the above documents.

I. DELIVERABLES

A. All deliverables were present as specified in the Statement of Work (SOW), SW-846, or in the project contract.

Yes No _____

This report has been requested to include the following review: QC, hold times, sample integrity (Chains of Custody, sample login), and summary calibrations. Note that there are 8 QC sets (days of analysis per instrument) and 3 instruments for the 47 samples.

The 2011 QAPP has been used for all review with the exception of the CCAL limits where the 25% NFG limits were applied as Method 8026B was used, not 8260C or the CLP method. Final application of these limits is being considered by project management.

B. Chain of Custody documentation was complete and accurate.

Yes No _____

No qualifiers have been added for Chain of Custody (COC) issues, and the Project Manager will update COC per the following notes to complete the project record.

Only the 1st and 3rd page of the Chain of Custody documents were signed and dated by the sampler. The laboratory has signed and affixed a receipt label on all pages. The relinquishment date and time are part of the electronically-generated COC.

These are electronically generated Chain of Custody documents, and there may be electronic signatures which are not currently reviewable. In addition, there are sample receipt acknowledgements from the laboratory.

However, the hardcopy documents should be properly signed and dated by the laboratory on each page. The log in forms contain the courier identification and air bill number.

C. Samples were received at the required temperature, preservation and intact with no bubbles.

Yes No _____

EPA regulations (See Federal Register, March 12, 2007, 40CFR Part 122) require only that the temperature of samples delivered to the laboratory be equal to or less than 6 °C. The sample temperature conditions are fully compliant with applicable regulations.

II. ANALYTICAL REPORT FORMS

A. The Analytical Report or Data Sheets are present and complete for all requested analyses.

Yes No _____

B. Holding Times

1. The contract holding times were met for all analyses [time of sample receipt to time of analysis (VOA) or time of extraction to time of analysis].

Yes No _____

2. The Clean Water Act (40 CFR 136) or method holding times were met for all analyses (14 days from time of sample collection to analysis or extraction).

Yes No _____

III. INSTRUMENT CALIBRATION – GC/MS

A. Initial Calibration

1. The Response (RF) and Relative Response Factors (RRF) and average RRF for all compounds for all analyses met the contract criteria of > 0.05 or > 0.01 for poor responding volatiles.

Yes No _____ NA _____

Method 8260: Per the Project Manager, the 2001 EPA CLP validation guidance has been applied to the common “poor responders.” Calibration response factors below 0.05 have historically been observed for Acetone. The validation guidance used for this project allows for a response of 0.01 for these compounds if spectral integrity can be verified at low concentrations. These spectra are not commonly provided and are not part of the deliverable for this data set. The laboratory has been tasked with providing to the client verification

that the 0.01 RF is valid. If the spectral verification is available, data are not qualified for response factors greater than 0.01 and less than 0.05 for “poor responders.” No data have been qualified.

Most of the low-responding compounds are highly water-soluble and capable of hydrogen bonding with water. This decreases their purge efficiency and results in the relatively low response. The implication of this low purge efficiency is that a relatively low absolute recovery of such compounds is achieved in the purge step of the analysis. If this recovery is consistent, reasonable accuracy and precision can be achieved in a given matrix, which is indicated for the lab matrix by acceptable recoveries in LCS and calibration checks. However, this causes these targets to be more sensitive to matrix variations that impact purge efficiency (such as ionic strength or the presence of varying levels of soluble non-target organic material) than are the more hydrophobic compounds typically analyzed by this method, and as a result they are more likely to exhibit matrix bias.

2a. The relative standard deviation (RSD) for the five point calibration was within the 30% limit for the CCCs.

Yes No _____ NA _____

This is a method requirement and indicates that the analytical system is in control.

2b. The relative standard deviation (RSD) for the five point calibration was within the 30% limit for all other compounds, the average % RSD was < 15%, or a linear curve was used.

Yes No _____ NA _____

3. The 12 hour system Performance Check was performed as required in SW-846 and met the QC limits of 80 – 120%.

Yes _____ No NA _____

Dichlorodifluoromethane is high in the 10/3/11 ICV for Instrument 8. It is also high in the LCS's for that instrument. The compound is not detected in client samples and no qualification is required.

B. Continuing Calibrations

1. The midpoint standard was analyzed for each analysis at the required frequency, and the QC criterion of > 0.05 (> 0.01 for CLP 2001 VOA) was met.

Yes No _____ NA _____

2. The percent difference (% D) limits of \pm 25% were met. The 2001 NFG also allow for 40% D for the “poor responders.” For other compounds, the QAPP notes rejection of detected compounds with % D > 40%.

Yes _____ No NA _____

See the table below. When there are no detections, no qualification is required unless the % D is biased low and so large as to indicate a significant probability of false negatives. Qualification is required for a % D biased high for detected compounds only. This requires that the RF is acceptable to verify the non-detect status, which is the case here.

Data would be qualified “JC#”, where # is the % D. There could be variability to the data as there is variability to the response. No qualifiers have been required.

The QAPP indicates that compounds in a run should be rejected if the % D is > 40%. We interpret this to mean that non-detects should be rejected and that detected compounds should be “J” qualified, which is the normal validation process for rejection. Professional judgment is that high bias CCVs with a % D greater than 40% should not be rejected for non-detects if the response factors are sufficient to ensure verification of the non-detect. Non-detects with % D values > 40% (low bias) are qualified “RC#”, where # is the % D.

The table below shows the outliers observed in CCVs for this report.

SDG	Batch	Analyte	% D	Bias	Qualifier
L11090899	WG377969	Hexachlorobutadiene	30.1	high	None, ND

SDG	Batch	Analyte	% D	Bias	Qualifier
	WG378381	Chloromethane	28.1	High	None, ND and also a poor responder

IV. GC/MS INSTRUMENT PERFORMANCE CHECK

The BFB (VOA) performance check was injected once at the beginning of each 12-hour period and relative abundance criteria for the ions were met.

Yes No _____ NA _____

V. INTERNAL STANDARDS

The Internal Standards met the 100% upper and -50% lower limits criteria, and the Retention times were within the required windows.

Yes No _____ NA _____

VI. SURROGATE STANDARDS

Surrogate spikes were analyzed with every sample.

Yes No _____

And met the recovery limits defined in the QAPP , which are the laboratory limits.

Yes No _____

VII. MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A. Matrix Spike (MS) and Matrix Spike Duplicate (MSD) were analyzed for every analysis performed and for every 20 samples or for every matrix whichever is more frequent.

Yes No _____

There are two MS/MSD samples associated with the 40 non-QC client samples: MW-164-ODPM-9 and MW-247-ODPM-9. This meets the recommendation of 1 per 20 field samples. As this is an ongoing project an overall adherence to the 1:20 frequency is monitored by the Project Manager.

B. The MS and MSD percent recoveries were within the limits defined in the updated 2011 QAPP, which now references the laboratory limits.

Yes _____ No NA _____

The full target list has been spiked.

For MW-247-ODPM-9, MTBE was reported at 125/ 132% (limit 123%); MIBK at 122/ 135% (limit 134%); acetone at 132/136% (limit 135%). For MW-164-ODPM-9, MTBE was reported at 122 and 128% (limit 123%). No data have been qualified JMS#, where # is the lowest recovery as all associated samples were non-detect for these compounds and there is no qualification for high bias.

C. The MSD relative percent differences (RPD) were within the defined contract limits, which are 30%.

Yes No _____ NA _____

Qualifiers are added only when the MS or MSD recovery is also out of limits or the RPD exceeds 30%. Data are qualified “JD#”, where # is the RPD. As the RPD increases, the matrix precision decreases. All RPD limits are met.

D. The MS/MSD were client samples.

Yes No _____ NA _____

VIII. LABORATORY CONTROL SAMPLE

A. Laboratory Control Sample (LCS) was analyzed for every analysis performed and for every 20 samples.

Yes No _____

B. The LCS percent recoveries were within the limits defined in the updated 2011 QAPP, which are the laboratory limits. If an LCS and LCSD are analyzed, both samples must have the same compounds out for data to be qualified.

Yes No X

The full target list has been spiked. When a high LCS recovery is associated with a non-detect in samples, no qualifier is added since the indicated bias is high. When the target is detected, data are qualified "JL#", where # is the recovery. Data could be biased high proportional to the LCS percent recovery. All results associated with low recoveries are qualified and data could be biased low. There were a number of high recoveries on Instruments 6 and 8. Only acetone has been qualified for high bias. The laboratory uses the same control limits on all 3 instruments used for analysis even though the responses are different on each instrument. The control limits should be instrument specific.

Laboratory Control Sample Recovery

IX. BLANKS

A. Method Blanks were analyzed at the required frequency and for each matrix and analysis.

Yes No _____

B. No blank contamination was found in the Method Blank.

Yes No _____

Whenever Methylene Chloride, Acetone, 2-Butanone are detected in associated samples at a level less than $10 \times$ the Method Blank (corrected for dilution), data are qualified “BMB#”, where # is the corrected Method Blank level. Results are usable as non-detect.

C. If Field Blanks were identified, no blank contamination was found.

Yes _____ No NA _____

The field blank is RB-ODPM-9, which is associated only with MW-160-ODPM-9. The sample was clean and no qualifiers have been applied for the low level acetone detection.

X. FIELD QC

If Field Duplicates were identified, they met guidance for VOA of RPD of < 30% for water or < 50% for soil. For values reported at $< 5 \times$ the reporting limit (RL), a difference of $2 \times$ RL or $3.5 \times$ RL for soil is used as guidance. This is referred to as the CRDL Rule. Data are not qualified for Field Duplicates as these are evaluated for the total project by the Project Manager.

Yes No _____ NA _____

There are four identified field duplicates as described in the following table. If data were qualified they would be J, FD#, where # is the difference between the two values as both values are less than $5 \times$ RL.

Parent Sample	Field Dup	Observations
MW-79-ODPM-9	DUP-1-ODPM-9	OK
MW-159-ODPM-9	DUP-2-ODPM-9	OK
MW-232-ODPM-9	DUP-3-ODPM-9	OK TCE at 24% .
MW-250-ODPM-9	DUP-4-ODPM-9	OK

XI. SYSTEM PERFORMANCE

A. The RICs, chromatograms, tunes and general system performance were acceptable for all instruments and analytical systems.

Yes _____ No _____ NA

Not part of this review level.

B. The suggested EQLs for the sample matrices in this set were met.

Yes No _____ NA _____

XII. TCL COMPOUNDS

A. The identification is accurate and all retention times, library spectra and reconstructed ion chromatograms (RIC) were evaluated for all detected compounds.

Yes _____ No _____ NA

Not part of this review level.

B. Quantitation was checked to determine the accuracy of calculations for representative compounds in each internal standards quantitation set.

Yes _____ No _____ NA

Not part of this review level.

XIII. TENTATIVELY IDENTIFIED COMPOUNDS

TICs were properly identified and met the library identification criteria.

Yes No NA X

Not part of this review level.

XIV. OVERALL ASSESSMENT OF THE CASE

The laboratory has complied with the requested method. Data are fully usable after consideration of qualifiers. The following is noted:

This report has been requested to include the following review: QC, hold times, sample integrity (Chains of Custody, sample login), and summary calibrations. Note that there are 8 QC sets (days of analysis per instrument) and 3 instruments for the 47 samples.

The 2011 QAPP has been used for all review with the exception of the CCAL limits where the 25% NFG limits were applied as Method 8026B was used, not 8260C or the CLP method. Final application of these limits is being considered by project management.

Chain of Custody

No qualifiers have been added for Chain of Custody issues, and the Project Manager will update documentation per the notes in the text to complete the project record.

Sample Preservation

EPA regulations (See Federal Register, March 12, 2007, 40CFR Part 122) require only that the temperature of samples delivered to the laboratory be equal to or less than 6 °C. The sample temperature conditions are fully compliant with applicable regulations.

Initial Calibrations

ICV

Dichlorodifluoromethane is high in the 10/3/11 ICV for Instrument 8. It is also high in the LCS's for that instrument. The compound is not detected in client samples and no qualification is required.

Continuing Calibrations

See the table within the body of this report. No data have been qualified as all %D recoveries are high and data are non-detect. No qualification is required for high bias when the response factor is acceptable to verify the non-detect as is the case here.

Matrix Spikes

There are two MS/MSD samples associated with the 40 non-QC client samples: MW-164-ODPM-9 and MW-247-ODPM-9. This meets the recommendation of 1 per 20 field samples. As this is an ongoing project an overall adherence to the 1:20 frequency is monitored by the Project Manager.

The full target list has been spiked.

For MW-247-ODPM-9, MTBE was reported at 125/ 132% (limit 123%); MIBK at 122/ 135% (limit 134%); acetone at 132/136% (limit 135%). For MW-164-ODPM-9, MTBE was reported at 122 and 128% (limit 123%). No data have been qualified JMS#, where # is the lowest recovery as all associated samples were non-detect for these compounds and there is no qualification for high bias.

Laboratory Control Samples

The full target list has been spiked. When a high LCS recovery is associated with a non-detect in samples, no qualifier is added since the indicated bias is high. When the target is detected, data are qualified "JL#", where # is the recovery. Data could be biased high proportional to the LCS percent recovery. All results associated with low recoveries are qualified and data could be biased low. There were a number of high recoveries on Instruments 6 and 8. Only acetone has been qualified for high bias. The laboratory uses the

same control limits on all 3 instruments used for analysis even though the responses are different on each instrument. The control limits should be instrument specific.

Field Blanks

The field blank is RB-ODPM-9, which is associated only with MW-160-ODPM-9. The sample was clean and no qualifiers have been applied for the low level acetone detection.

Field QC

There are four identified field duplicates as described in the following table. If data were qualified they would be J, FD#, where # is the difference between the two values as both values are less than 5 x RL.

Parent Sample	Field Dup	Observations
MW-79-ODPM-9	DUP-1-ODPM-9	OK
MW-159-ODPM-9	DUP-2-ODPM-9	OK
MW-232-ODPM-9	DUP-3-ODPM-9	OK TCE at 24% .
MW-250-ODPM-9	DUP-4-ODPM-9	OK

TABLE OF QUALIFIED DATA

Final Data Qualification and Usability Report

Project: Defense Depot Memphis, TN (DDMT)
Off-Depot PM/LTM
Sampling Event: ODPM-9
Project / Task Number: 121842-003
Sample Data Package(s): L11090899
Data Validation Performed by: Diane Short & Associates (DSA)
Final Data Qualification and Usability
Report Prepared by: Lynn K. Lutz, HDR Inc.

Data Validation Report Review and Comments

The data validation report was acceptable. It appears the validator included the two sets of MS/MSD in the total sample count.

Final Data Qualifiers

Final qualifiers for detected acetone results with LCS recoveries above control limits were J where DSA had qualified as JL139, JL140 or JL147.

Final qualifiers were J where detected results were between the MDL and RL.

Data Usability

There were no rejected sample results. All results are usable as qualified.

09 January 2012

Dunn Field - Defense Depot Memphis, Tennessee

MW-249

Analyte	Well ID	MW-249
	Sample Date	9/27/2011
	UNIT	
1,1,2,2-Tetrachloroethane	µg/L	0.6
1,1,2-Trichloroethane	µg/L	<1
1,1-Dichloroethene	µg/L	<1
Carbon tetrachloride	µg/L	3.47
Chloroform	µg/L	19.9
cis-1,2-Dichloroethene	µg/L	0.892 J
Tetrachloroethene	µg/L	0.51 J
trans-1,2-Dichloroethene	µg/L	<1
Trichloroethene	µg/L	12.4
Vinyl chloride	µg/L	<1

Notes:

µg/L micrograms per liter

RL reporting limit

DQE Flags:

J Estimated results based on QC data or reported below RL

< Not detected at sample reporting limit
