1 Introduction

HDR has prepared this 2017 Annual Long-term Monitoring (LTM) Report for the Main Installation (MI) and Dunn Field at the former Defense Depot Memphis, Tennessee (DDMT) under Contract W90FYQ-09-D-0005, Task Order CK04 to the United States Army Corps of Engineers (USACE), Mobile District. The environmental restoration program at DDMT is directed by the Department of the Army, Office of the Assistant Chief of Staff for Installation Management, Base Realignment and Closure (BRAC) Division.

LTM at the MI and Dunn Field is performed to document changes in plume concentrations, to detect potential plume migration to off-site areas or into deeper aquifers, and to track progress toward remediation goals. LTM activities at DDMT are performed in accordance with the MI LTM Plan in Appendix B of the *Main Installation Final Remedial Design, Revision 1* (MI RD) (CH2M HILL 2004a) and the Dunn Field LTM Plan in Appendix C of *Off Depot Groundwater Final Remedial Design, Revision 1* (Off Depot RD) (CH2M HILL 2008). DDMT's United States Environmental Protection Agency (USEPA) Identification Number is TN4210020570.

Responses to comments from USEPA and Tennessee Department of Environment and Conservation (TDEC) and approval letters from USEPA and TDEC are included in Appendix A.

1.1 Site Location and Description

DDMT is located in southeastern Memphis, Shelby County, Tennessee approximately 5 miles east of the Mississippi River and 2 miles north of Memphis International Airport (Figure 1). DDMT originated as a military facility in the early 1940s; it received, warehoused, and distributed supplies common to all United States (US) military services and some civil agencies located primarily in the southeastern US, Puerto Rico, and Panama. Stocked items included food; clothing; petroleum products; construction materials; and industrial, medical, and general supplies. In 1995, DDMT was placed on the list of the Department of Defense facilities to be closed under BRAC. Storage and distribution of material continued until the facility closed in September 1997.

The property consists of approximately 632 acres and includes the MI and Dunn Field. The MI covers approximately 567 acres and had open storage areas, warehouses, military family housing, and outdoor recreational areas. Dunn Field, which is located across Dunn Avenue from the north-northwest portion of the MI, covers approximately 65 acres and had mineral storage and waste disposal areas.

In 1992, DDMT was added to the National Priorities List (NPL) (57 Federal Register 47180 No. 199). Responsibility for environmental restoration at DDMT transferred from the Defense Logistics Agency to the Department of the Army in December 2010. The regulatory oversight agencies are USEPA Region 4 and TDEC.

1.2 Geology and Hydrogeology

The geologic units of interest at DDMT are (from youngest to oldest): loess, including surface soil; fluvial deposits; Jackson Formation/Upper Claiborne Group (Jackson/Upper Claiborne); and Memphis Sand.

The loess consists of wind blown and deposited brown to reddish-brown, low-plasticity clayey silt to silty clay. The loess deposits are about 20 to 30 feet (ft) thick and are continuous throughout DDMT.

The fluvial (terrace) deposits at DDMT consist of two general layers. The upper layer is silty, sandy clay to clayey sand and ranges from about 0 to 30 ft thick. The lower layer is composed of interlayered sand, sandy gravel, and gravelly sand, and ranges from 30 to 100 ft thick. The uppermost aquifer is the unconfined Fluvial Aquifer, consisting of saturated sands and gravelly sands in the lower portion of the deposits. The base of the Fluvial Aquifer is controlled by the surface of the uppermost clay in the Upper Claiborne; the saturated thickness ranges from 0 ft (dry) to approximately 70 ft. The groundwater in the Fluvial Aquifer is not a drinking water source for area residents; however, the current Tennessee groundwater classification at DDMT is General Use (TDEC Chapter 1200-04-03).

The Jackson/Upper Claiborne forms the upper confining unit for the Memphis Aquifer (MAQ) on a regional basis and separates the Fluvial Aquifer from the MAQ at DDMT. The Jackson Formation is reported to be absent in the area of DDMT. The Upper Claiborne Group includes the Cockfield and Cook Formations. The Cockfield Formation consists of inter-fingering fine sand, silt, clay, and local lenses of lignite. The Cook Mountain Formation consists primarily of clay with varying amounts of fine sand and is reported to be the most persistent clay layer in the Jackson/Upper Claiborne confining unit (Parks 1990). The Intermediate Aquifer (IAQ) is locally developed in the Upper Claiborne sands. Where the clay is thin or absent, a hydraulic connection or ‘window’ is created between the Fluvial Aquifer and the IAQ, and potentially, the MAQ.

The Memphis Sand primarily consists of thick-bedded, white to brown or gray, very fine grained to gravelly, partly argillaceous and micaceous sand. The Memphis Sand ranges from 500 to 890 ft in thickness, and begins at a depth below ground surface (bgs) of approximately 120 to 300 ft. The MAQ is a regional deep, confined aquifer and is the primary source of water for the City of Memphis. The Allen Well Field, which is operated by Memphis Light, Gas & Water (MLGW), is located approximately 2 miles west of Dunn Field.

1.3 Remedial Action

The selected remedies in the decision documents for DDMT have been implemented. The *Preliminary Close Out Report* (USEPA 2010) was approved in May 2010 and the DDMT NPL site status was revised to Construction Complete in May 2010.

1.3.1 Main Installation

Remedial action objectives (RAOs) for the MI were established in the *Main Installation Record of Decision* (MI ROD) (CH2M HILL 2001). The groundwater RAOs are:

- to prevent ingestion of water contaminated with volatile organic compounds (VOCs) in excess of maximum contaminant levels (MCLs) from potential future on-site wells;
- to restore groundwater to concentrations at or less than MCLs; and
- to prevent migration horizontally and vertically offsite of groundwater contaminants in excess of MCLs.

The groundwater remedy selected in the MI ROD was enhanced bioremediation treatment (EBT) with LTM and land use controls. The MI ROD stated EBT would target the most contaminated areas and untreated parts of the groundwater plume would degrade under natural attenuation; the MI RD used groundwater concentrations of 100 micrograms per liter (µg/L) for tetrachloroethene (PCE) and trichloroethene (TCE) to delineate the treatment areas. The first round of EBT (EBT-1) was implemented from September 2006 to February 2009 in the southwest and southeast areas of the MI, which were designated target treatment area (TTA)-1 and TTA-2, respectively. Performance monitoring was conducted quarterly from October 2006 through March 2009. Chlorinated volatile organic compound (CVOC) concentrations were reduced over 90 percent in injection wells (IWs) and over 80 percent in performance monitoring wells (PMWs) at locations with baseline concentrations above 100 µg/L. The *Main Installation Interim Remedial Action Completion Report, Revision 1* (MI IRACR) (HDR|e^{2}M 2010) was approved by USEPA in March 2010.

Additional EBT (EBT-2) was implemented from November 2012 to November 2014 due to rebound in CVOC concentrations in LTM samples. Quarterly injections and monitoring were conducted in five areas where individual CVOC concentrations of parent compounds (PCE, TCE and carbon tetrachloride [CT]) exceeded 100 µg/L: TTA-1N, TTA-1S, TTA-2, the West-Central plume and the Building 835 plume. Quarterly injections were made from November 2012 to August 2014 and performance monitoring was conducted from February 2013 to November 2014. The final report for EBT-2, *Main Installation Year Four Enhanced Bioremediation Treatment Report, Revision 0* (HDR 2015), was approved by USEPA and TDEC in May 2015. The CVOC concentrations in the final samples (November 2014) decreased from the baseline samples (December 2011) by an average of 80 percent for IWs and 28 percent for PMWs; the total number of EBT wells exceeding MCLs decreased from 55 wells to 17 wells over the same period. While EBT-2 reduced CVOC concentrations, it was not sufficient to meet the groundwater RAOs for the MI.

A Supplemental Remedial Investigation (SRI) is currently being performed for the MI to address data gaps identified through EBT performance monitoring and LTM. A Focused Feasibility Study (FFS) will be conducted upon completion of the SRI to update the remedial strategy. An Explanation of Significant Differences or a ROD Amendment will be prepared as necessary to document changes to the selected remedy. Further RA will be conducted after the FFS is completed and the selected remedy has been confirmed or revised.

The *Supplemental Remedial Investigation Phases 1 and 2 Report, Revision 0* (HDR 2017d) was submitted to USEPA and TDEC for review in November 2017. Conclusions from document review addressed hydraulic connections between the Fluvial Aquifer and the MAQ in the Memphis area and at DDMT; limits to natural attenuation of CVOCs in groundwater at DDMT due to low natural carbon and high dissolved oxygen in groundwater; and findings from the 2009 groundwater model (HDR|e^{2}M 2010). Conclusions from the field investigation addressed site hydrogeology and plume delineation.

Additional work is planned to complete the SRI, with concurrence from USEPA and TDEC, in order to provide sufficient information for evaluation of remedial alternatives in the FFS and to develop a successful strategy for RA. The *Supplemental Remedial Investigation Phase 3 QAPP* (HDR 2017e) was submitted to USEPA and TDEC on 7 November 2017.

1.3.2 Dunn Field

The *Record of Decision for Interim Remedial Action of the Groundwater at Dunn Field (OU-1)* (CH2M HILL 1996) was signed in April 1996 with the objective of hydraulic containment to prevent further contaminant plume migration and reduce contaminant mass in groundwater. The interim remedial action (IRA) groundwater recovery system included 11 recovery wells (RWs) screened in the Fluvial Aquifer along the western boundary of Dunn Field. Based on reduction of CVOC concentrations in groundwater following implementation of the Dunn Field Source Areas RA, five RWs were shutdown in June 2008 and the remaining RWs were shutdown in January 2009. The IRA system was removed and the RWs abandoned in July 2010.

The groundwater RAOs established in the *Memphis Depot Dunn Field Record of Decision* (Dunn Field ROD) (CH2M HILL 2004b) are:

- to prevent human exposure to contaminated groundwater (i.e., exceeding protective target concentrations [TC])
- to prevent further off-site migration of VOCs in excess of protective target levels
- to remediate Fluvial Aquifer groundwater to drinking water quality to be protective of the deeper MAQ.

The remedies were implemented in three phases: Disposal Sites, Source Areas and Off Depot. The selected remedies for the Source Areas and Off Depot were modified through the *Dunn Field Record of Decision Amendment* (ROD Amendment) (e^{2}M 2009) approved in January 2009.

The Disposal Sites RA included excavation and off-site disposal of soil and waste material from five sites and was completed in 2006. The *Dunn Field Disposal Site Remedial Action Completion Report* (MACTEC 2006) was approved by USEPA in August 2006.

The Source Areas RA was to include soil vapor extraction (SVE) in the vadose zone and injection of zero valent iron (ZVI) in groundwater. The Fluvial SVE (FSVE) in fluvial soils (30 to 70 ft bgs) was operated from July 2007 to July 2012 and removed approximately 4,000 pounds of VOCs. Thermal SVE, or in situ thermal desorption, was implemented in the loess (0 to 30 ft

bgs) from May to December 2008 and removed approximately 12,500 pounds of VOCs. ZVI injection was not required due to the success of SVE in reducing groundwater impacts. Excavation and off-site disposal of soil and waste material were also conducted in two additional areas; the work was performed in two phases, October 2007 to January 2008 and February to June 2009, so as not to interfere with thermal SVE implementation. The *Dunn Field Source Areas Interim Remedial Action Completion Report, Revision 1* (Source Areas IRACR) (HDR|e^{2}M 2009) was approved by USEPA and TDEC in November 2009.

The FSVE system was shut down in July 2012 after meeting soil remediation goals; LTM results at nearby wells are evaluated for potential rebound in CVOC concentrations. The FSVE system and nearby LTM wells are shown on Figure 2.

The Off Depot RA included installation of an air sparging with SVE (AS/SVE) system with 90 AS points and 12 SVE wells; operations began in December 2009. AS/SVE in combination with natural attenuation processes is expected to reduce groundwater concentrations to MCLs in accordance with the RAOs in the Dunn Field ROD. The AS/SVE system with nearby LTM wells is shown on Figure 3. The *Dunn Field Off Depot Groundwater Interim Remedial Action Completion Report, Revision 1* (Off Depot IRACR) (HDR 2011a) was approved by USEPA in August 2011 and by TDEC in November 2011.

Overall performance of the AS/SVE system is evaluated based on results of LTM analyses. The AS/SVE system was installed to intercept the majority of the Off Depot CVOC plume and to reduce individual CVOC concentrations below 50 µg/L. Operations are to continue until the upgradient concentrations from the Dunn Field plume do not exceed 50 µg/L for individual CVOCs in upgradient wells. Since April 2012, only TCE in one LTM well near the AS/SVE system, MW-159, has exceeded the 50 µg/L objective.

The latest annual report, *Off Depot Air Sparge-Soil Vapor Extraction System Annual Operations Report, Year Six, Revision 0* (HDR 2017b), was submitted to USEPA and TDEC in August 2017. The AS/SVE system has removed approximately 86 pounds of VOCs through April 2017. In order to address the continued high concentration of TCE at MW-159, additional AS wells will be installed south of MW-159 to increase removal of CVOCs from groundwater. The new AS wells will be installed upon completion of an updated access agreement with MLGW and will be incorporated into system operations following installation. Since the active remediation goal of CVOC concentrations at 50 µg/L (or less) has not been met, operations are planned to continue through May 2019.

1.4 Previous Groundwater Monitoring

The *Annual Long-Term Monitoring Report-2016, Revision 1* (HDR 2017c) was approved by TDEC in June and by USEPA in October 2017. During preparation of the report, the well classifications in the LTM plan were reviewed in response to suggestions from USEPA and the BRAC Environmental Coordinator. The LTM plans for the MI and Dunn Field were prepared in 2004 and 2008, respectively. Information on site hydrogeology and contaminant extent at DDMT has increased significantly since that time, especially for the MI where approximately 100 LTM wells have been installed since the LTM plan was completed. Based on the review, well

classifications were revised from the initial purpose-based criteria (background, boundary, sentinel and performance) to classification by aquifer and plume/area.

LTM wells were assigned to the Fluvial, Intermediate or Memphis Aquifers. The upper clay layer in the Upper Claiborne, which usually forms the base of the Fluvial Aquifer, is absent in the central part of the MI, and the Fluvial sand and the Upper Claiborne sand form a single water table aquifer. Several deeper wells in this area are designated Upper Claiborne and are grouped with the IAQ wells.

In addition to classification by aquifer, the wells are grouped by area or plume. The areas for MI LTM wells are: TTA-1 North, TTA-1 South, TTA-2, West-Central, Building 835, North-Central, South-Central, Southeast MI and Background. The areas for Dunn Field LTM wells are: DF North, DF West, Off Depot and Background. The Background wells at the MI and Dunn Field were selected based on criteria in the LTM Plans (wells upgradient of or at a distance from groundwater plumes and with no, or low, previous detections of site contaminants).

The 2016 LTM report also included review and revision of the sample frequencies for LTM wells. The following criteria were established:

- New wells will be sampled semiannually over 2 years prior to a frequency being determined.
- Wells with stable concentrations below the MCL in the eight most recent samples will be sampled biennially.
- Wells with stable concentrations approximately two times the MCL or less will be sampled annually.
- All other wells will be sampled semiannually.
- The following exceptions to the criteria will be made:
    - The MI wells screened in the Memphis Sand (MW-254 and MW-255) have not exceeded MCLs in samples collected since installation in 2010 but will continue to be sampled annually due to increased concentrations in upgradient wells.
    - The DF North wells, which commonly exceed an MCL (MW-07, MW-08, MW-31, MW-79, MW-129, MW-130, MW-220 and MW-230), will continue to be sampled annually until the need for remedial action is determined.
    - Off Depot wells installed adjacent to the AS/SVE system for performance monitoring (MW-241 to MW-247) will be sampled more frequently than required by the new criteria in order to monitor AS/SVE performance.

2 Long-Term Monitoring Activities

LTM activities during 2017 consisted of monitoring designated LTM wells at the MI and Dunn Field during sampling events in April and October. Field activities and laboratory analyses were performed in accordance with the *2017 Uniform Federal Policy-Quality Assurance Project Plan, Revision 0* (2017 QAPP) (HDR 2017a).

The MI LTM wells are listed on Table 1; the well locations are shown on Figure 4.The 148 MI LTM wells consist of 115 wells in the Fluvial Aquifer, 30 wells in the IAQ/Upper Claiborne (IAQ/UC) and 3 wells in the MAQ. Sample frequencies for wells by aquifer are:

- 115 Fluvial Aquifer - semiannual (74), annual (23) and biennial (18);
- 30 IAQ/UC - semiannual (14), annual (12) and biennial (4); and
- 3 MAQ - semiannual (1) and annual (2).

The classification, sample frequency, and 2017 sample events for MI LTM wells are shown on Table 3.

The Dunn Field LTM wells are listed on Table 2; the locations are shown on Figure 5. The 85 Dunn Field LTM wells consist of 80 wells in the Fluvial Aquifer, 4 wells in the IAQ/UC and 1 well in the MAQ. Sample frequencies for wells in each aquifer are:

- 80 Fluvial Aquifer - semiannual (13), annual (31) and biennial (36);
- 4 IAQ/UC - annual (2) and biennial (2); and
- 1 MAQ - biennial.

The classification, sample frequency, and 2016 sample events for Dunn Field LTM wells are shown on Table 4.

2.1 Groundwater Monitoring

Groundwater levels are measured in all LTM wells on the MI and Dunn Field prior to sampling for LTM events. Measurements are made using water level meters with electronic sensors and tapes graduated in 0.01-ft increments.

Groundwater samples are generally collected from monitoring wells using passive diffusion bags (PDBs) where the saturated screened interval is 5 ft or greater and field water quality measurements are not required. Samples are collected with bladder pumps or with bailers where PDBs are not installed.

When samples are collected using a PDB, a sample of water from the PDB removed from the well is transferred to 40-milliliter (mL) vials preserved with hydrochloric acid. Following sample collection, a new PDB is filled with de-ionized water and placed in the middle of the saturated section of well screen. Water quality parameters are not measured prior to sampling wells with PDBs.

When samples are collected using bladder pumps and low-flow purging methods, dedicated Teflon® bladders and Teflon®-lined polyethylene tubing are used. The water level and pumping rate at each well are monitored in order to limit water level decline to 4 inches (0.1 meter) or less. Following sampling, the bladder and tubing for each well are placed in separate, sealed plastic bags and stored for future sampling events. Water quality parameters are measured at approximately 5 to 10 minute intervals during purging using a flow-through cell with a water quality meter. The meter is calibrated each morning prior to sampling, and if abnormal readings are observed during the day, the instrument is recalibrated in the field. Purging continues at each well for up to 2 hours in order to meet the stabilization criteria: three successive readings within 0.1 for pH, 10 millivolts for oxygen reduction potential, 3 percent for specific conductance, 10 percent for dissolved oxygen and less than 20 nephelometric turbidity units for turbidity. Temperature is also recorded, but not used as a stabilization parameter.

Wells sampled with a disposable Teflon® bailer are purged of three well volumes or until the well is purged dry. Stabilization parameters are collected using the same instrumentation as the wells sampled with a bladder pump; a sampling cup is filled from the bailer and a set of stabilization parameters are collected at minimum for every well volume.

All measurements are noted on the field sampling forms. Samples are collected in 40-mL vials preserved with hydrochloric acid when stabilization criteria are met or the field team leader approves a variance from the criteria.

MI LTM well PZ-03 was installed in October 1998 as a piezometer with 1-inch diameter PVC casing and screen. The piezometer has been sampled with a small diameter disposable Teflon® bailer. Sampling has become increasingly difficult in recent years due to difficulty in lowering a bailer or small-diameter bladder pump to the well screen; samples could not be collected from PZ-03 in 2017.

Samples were sent to Microbac Laboratories in Marietta, Ohio for VOC analysis by Method SW8260B. The activities during the two sampling events are summarized in the following sections.

2.1.1 April 2017

Groundwater levels were measured in all LTM wells at the MI and Dunn Field on 17 and 18 April. The water level measurements are shown on Table 5 for the MI and Table 6 for Dunn Field.

2.1.1.1 Main Installation

Semiannual groundwater sampling was conducted on 19 to 24 April 2017 with samples collected from 104 wells. There were 89 MI LTM wells identified for semiannual sampling in 2017 (see Section 2); a sample could not be collected from PZ-03, as noted above. Samples were collected from 16 wells identified for annual sampling (see Table 3), because the updated sample frequencies presented in the 2016 LTM report had not been reviewed by USEPA and TDEC before the April 2017 sample event. There were 106 groundwater samples collected; samples were collected from two screened intervals at MW-101 and MW-107.

Groundwater samples were collected from 92 wells using PDBs. The sample from well PMW101-02A was not usable due to excessive headspace when received at the laboratory. The PDB sample depths are shown on Table 7.

Eleven wells (DR2-5 and SRI Phase 2 wells MW-274 to MW-283) were sampled using a bladder pump. PMW101-02A was re-sampled on 24 April using a bladder pump; the vials were received at the laboratory with no problems observed. One well, MW-213, was sampled with a bailer after three well volumes were removed. The final stabilization measurements are shown on Table 8.

Turbidity measurements were out of range at two former EBT wells (DR2-5 and PMW101-02A) due to organic content and very dark purge water. PMW101-02A was sampled after the other parameters stabilized; DR2-5 was purged dry on 21 April and sampled on 22 April after the water level had recovered sufficiently. The SRI Phase 2 wells were sampled after stabilization criteria were met, except for MW-283 which was sampled with turbidity at 58 NTUs after purging for two hours.

2.1.1.2 Dunn Field

Biennial groundwater sampling was conducted with samples collected from all 85 LTM wells on 22 and 23 April 2017. Groundwater samples were collected from 82 wells using PDBs. The sample depths are shown on Table 9.

Three wells (MW-08, MW-58 and MW-126) were sampled using a bladder pump due to limited saturated thickness or variable water level. The samples were collected when stabilization criteria were met. The final stabilization measurements are shown on Table 8.

2.1.2 October 2017

Groundwater levels were measured in all LTM wells at the MI and Dunn Field on 3 to 6 October. The water level measurements are shown on Table 5 for the MI and Table 6 for Dunn Field.

A total of 18 samples were received at the laboratory with head space in one or more of the sample vials. While this had been observed during previous sample events, it had involved only a few samples and was limited to wells previously used as EBT IWs where ongoing biological activity was considered the cause. Following discussions with Microbac Laboratories after the sample event, it was determined that the problem was due to the sample vials supplied by the laboratory. Field samples usually consisted of three vials from each well, but often consisted of two vials when duplicate samples or matrix spike/matrix spike duplicates (MS/MSD) were collected at the well.

Twelve of the 18 samples had one or two vials without head space, and the analyses were completed without issue. The remaining six samples with head space in all vials consisted of four field samples, one duplicate and one trip blank. Analyses for two of the field samples were completed using sample vials collected for a duplicate or MS/MSD at the same well. The other two field samples were re-collected (MW-203A and DR1-6A) with an associated duplicate

(DUP-8-LA-26) at one of the wells. The trip blank could not be recollected and the analysis was performed with an affected vial.

The height of the PVC well casing in MI LTM well MW-210B did not allow the manhole cover to fit properly, and the cover appeared to have been damaged during recent mowing; the PDB in the well did not appear to be damaged and was used during sampling. The well casing was cut down by less than one inch and a new well cover was installed on 11 October, and the top of casing (TOC) was re-surveyed by Allen & Hoshall, a registered land surveyor, on 12 October. A discrepancy was noted during HDR's review of the new elevation data; the new TOC elevation was higher than the previous elevation even though the TOC had been lowered. Allen & Hoshall determined that a transposed number in the control point elevation had been used during their initial elevation survey in 2007 following installation of the wells; the horizontal coordinates were not affected. Allen & Hoshall recalculated the elevations for the affected wells; their report is included in Appendix B. The corrected elevations differ from the initial 2007 elevations by less than 0.5 ft. Some of the wells had their top of casing modified and elevations re-surveyed in 2013; the 2013 survey data did not require revision. Groundwater elevations based on the corrected TOC elevations were more consistent with adjacent wells than those based on the original 2007 TOC elevations. Groundwater elevations and contour maps for the MI are discussed in Section 3.1.1.2.

2.1.2.1 Main Installation

Annual groundwater sampling was conducted on 7 to 12 October 2017 with samples collected from 125 of 126 designated wells; a sample could not be collected from PZ-03, as noted above. There were 127 groundwater samples collected; samples were collected from two screened intervals at MW-101 and MW-107.

Groundwater samples were collected from 121 wells using PDBs, but samples from two wells (DR1-6A and MW-203A) were not usable as noted above. The PDB sample depths are shown on Table 7.

Three wells with PDBs previously installed (MW-203B, MW-274 and MW-283) were sampled using a portable bladder pump with dedicated tubing and bladder. The PDB in MW-203B appeared to be damaged and was not used; the PDB tethers for MW-274 and MW-283 were switched during installation and the PDBs were not at appropriate depths for sampling. Two wells were purged and sampled with a bailer: DR2-5 and MW-213. DR2-5 was bailed dry and sampled after the water level recovered on the same day, 10 October. MW-213 was sampled with a bailer due to limited saturated thickness. DR1-6A and MW-203A were re-sampled on 11 and 12 October, respectively; new bailers were used because dedicated bladders and tubing were not available and could not be obtained before the sample event ended. DR1-6A, MW-203A and MW-213 were sampled after at least three well volumes were purged. The final stabilization measurements are shown on Table 8.

2.1.2.2 Dunn Field

Semiannual groundwater sampling was conducted on 5 and 6 October 2017 with samples collected from 16 wells. There are 13 Dunn Field LTM wells identified for semiannual sampling

in 2017 (see Section 2). Samples were collected from 3 wells (MW-06, MW-57 and MW-70) identified for annual or biennial sampling (see Table 4), because of increased concentrations in the April 2017 samples.

Groundwater samples were collected from all 16 wells using PDBs. The sample depths are shown on Table 9.

2.2 Waste Disposal

The waste generated during LTM activities in 2017 was classified as either non-investigative waste or investigation-derived waste (IDW). Non-investigative waste, such as packaging materials, personal protective equipment, disposable sampling supplies, and other inert refuse, was collected, containerized, and placed in the collection bin at the HDR field office for disposal at a municipal landfill. The IDW consisted of waste water from equipment decontamination and groundwater from purging prior to sampling and from excess water in PDBs.

The waste water was collected in 5-gallon buckets with lids and added to the condensate storage tank on Dunn Field. When the storage tank nears capacity, grab samples of wastewater will be collected for analysis of VOCs and selected metals prior to discharge per agreement with TDEC.

This page intentionally left blank.

3 Summary of Monitoring Results

3.1 Hydrogeology

Water level measurements for the 2017 LTM events at the MI are shown on Table 5 for the MI and on Table 6 for Dunn Field. Site-wide groundwater elevations are shown on Figures 7 and 8 for the Fluvial Aquifer, on Figures 9 and 10 for the IAQ/UC and on Figures 11 and 12 for the MAQ.

3.1.1 Main Installation

3.1.1.1 Top of Clay and Cross-Section

Additional lithological data for DDMT was obtained since the October 2016 LTM event through installation of the SRI Phase 2 wells (MW-274 through MW-284) in November 2016 and April 2017. The elevation of the top of the uppermost clay in the Upper Claiborne is shown on Figure 13. The most noticeable features are the gap in the upper clay in the northwestern MI and the increasing depth of clay in the central MI. The lowest observed elevation of the clay is 93.4 ft NAVD at MW-209A. All elevations cited in this report are based on the North American Vertical Datum of 1988 (NAVD).

Cross-section A, which runs south from MAQ well MW-254 in the northwest corner of the MI to Fluvial Aquifer well MW-24 on the central southern boundary, is shown on Figure 6. The section includes several IAQ wells within the ‘window’ and the West-Central area and shows the variability in the Upper Claiborne on the MI. Where the upper clay is present, it forms the base of the Fluvial Aquifer and where it is absent, the fluvial sands and the Upper Claiborne sand form a combined water table aquifer. Further to the north on the cross-section (near MW-140), the lower clay is deeper or absent allowing vertical groundwater movement and potential contaminant migration to the MAQ. MW-140 is included as an MAQ well although it is screened within the Upper Claiborne; the screened depth and the groundwater elevation are consistent with the MAQ wells.

3.1.1.2 Groundwater Elevations

The Fluvial Aquifer groundwater elevation contours are shown on Figures 7 and 8. Groundwater flow in the Fluvial Aquifer appears to be onto the MI from all sides with flow off the MI through vertical leakage at the window in the northwest MI and the sink in the south-central MI.

Groundwater elevations are highest in the northeast corner of the MI (MW-16: approximately 244 ft NAVD) and lowest at the suggested sink in the south-central MI (MW-259: approximately 202 ft NAVD). Groundwater flow near TTA-1 is to the east and northeast with a hydraulic gradient of approximately 0.003 in April and October (MW-219 to MW-210B). The groundwater flow near TTA-2 is to the west-southwest with a hydraulic gradient of approximately 0.014 in April and 0.013 in October (DR2-1 to MW-26).

The IAQ groundwater elevation contours shown on Figures 9 and 10 indicate groundwater flow into and through the window in the northwest MI. The water levels for the IAQ wells in the 'window' indicate flow is generally to the northwest with groundwater elevations decreasing from MW-107 (approximately 207.0 ft NAVD in April and 206.4 ft NAVD in October) to MW-34 (approximately 181.8 ft NAVD in April and 178.4 ft NAVD in October). The hydraulic gradient in the 'window' is to the northwest at approximately 0.017 in April and 0.019 in October (MW-107 to MW-34). The IAQ well locations at the downgradient end of the window (MW-256, MW-262 and MW-273) indicate the groundwater flow is to the north.

The MAQ groundwater elevation contours are shown on Figures 11 and 12. The groundwater elevations in the three wells on the MI (MW-140, MW-254 and MW-255) ranged from approximately 173.6 to 175.0 ft NAVD in April and 167.8 to 168.8 ft NAVD in October. The elevation contours, including Dunn Field MAQ well MW-67, indicate the groundwater flow direction is to the southwest. The number of wells in the MAQ is not sufficient to clearly define the flow direction. The central section of the Allen Well Field is located to the west-northwest of the MI, which suggests the hydraulic gradient should be to the west.

3.1.2 Dunn Field

The Fluvial Aquifer groundwater elevation contours on Figures 7 and 8 show groundwater flows to the west across Dunn Field toward a trough in groundwater elevations approximately 1,200 ft west of Dunn Field, where flow diverges to the north and south. As noted in Section 1.2, the base of the Fluvial Aquifer is controlled by the surface of the uppermost clay in the Upper Claiborne; a trough in the surface of the underlying clay (Figure 13) has resulted in the trough in the potentiometric surface west of Dunn Field. The AS/SVE system is located on the eastern side of the trough. The approximate hydraulic gradient across Dunn Field is 0.010 (MW-28 to MW-242). Groundwater elevations are highest northeast of Dunn Field (MW-130: approximately 239.8 ft NAVD) and decrease toward the trough west of Dunn Field (MW-165: approximately 220.6 ft NAVD).

The IAQ groundwater elevation contours are shown on Figures 9 and 10. The groundwater elevations in the IAQ wells MW-237, MW-250 and MW-251 averaged 176.0 ft NAVD in April and 170.4 ft NAVD in October. The groundwater elevation in MW-169, which is screened in an Upper Claiborne sand within an area of possible leakage from the Fluvial Aquifer about 1,000 ft north of the other IAQ wells, was 201.55 ft NAVD in April and 199.40 ft NAVD in October.

The MAQ groundwater elevation contours are shown on Figures 11 and 12. The groundwater elevation in MW-67 was 175.58 ft NAVD in April and 169.84 ft NAVD in October.

3.1.3 Precipitation and Water Levels

Historical precipitation data and groundwater elevations at DDMT are reviewed to evaluate whether there was seasonal variation in water levels, which could affect CVOC concentrations through dilution or increased groundwater flow. The review, begun in 2015, has indicated that the Fluvial Aquifer wells do not have significant seasonal variability and that IAQ and MAQ wells

have consistent annual variation with higher water levels in the spring and lower levels in the fall. The current schedule of sampling events in April and October is considered appropriate.

Precipitation data for the Memphis area and groundwater elevations at selected monitoring wells were updated for the current report. The updated tables and figures are provided in Appendix C.

The precipitation data, which was recorded at Memphis International Airport, includes monthly rainfall for May 2010 through December 2017 and monthly averages for the near-term (post 2011) and the long-term (1981-2010). The actual monthly rainfall and the monthly averages are listed on Table C-1 and plotted on Figure C-1. The total annual rainfall for 2011 through 2017, and for the long-term and short-term monthly averages, is also listed on Table C-1.

The monthly maximum and minimum precipitation totals (in inches) for each year are listed in the table below.

Year	Monthly Maximum (inches)		Monthly Minimum (inches)	
2010	May	9.3	September	0.1
2011	April	11.8	October	1.3
2012	September	7.0	April	1.0
2013	May	10.8	August	2.2
2014	June	13.4	August	1.8
2015	November	10.2	January	1.3
2016	March	16.2	September	0.7
2017	August	9.3	February	1.4

Fourteen monitoring wells were selected for comparison of groundwater elevations with monthly precipitation data. The selected wells, located throughout DDMT, are shown on Figure C-2. The wells are listed on Table C-2 with location, aquifer and groundwater elevations measured from March 2010 through December 2017. The actual monthly precipitation totals and groundwater elevations are shown on Figure C-3 for Fluvial Aquifer wells and on Figure C-4 for IAQ and MAQ wells.

The groundwater elevations at most wells have risen since 2010. The increase is likely due to the total annual rainfall exceeding the average annual rainfall in 2011, 2013, 2014 and 2016 (Table C-1). While the Fluvial Aquifer wells show a relatively smooth trend, the IAQ and MAQ wells also have a semiannual variation with elevations higher in the spring and lower in the fall. The semiannual variation in the deeper wells is likely due to higher groundwater extraction from the MAQ in the summer and fall.

3.2 Data Quality Evaluation

Data collected during the 2017 LTM events were reviewed based on guidelines in the QAPP. Data review was performed by an independent data validation contractor, Diane Short and Associates, Inc. The complete analytical results for field and quality control (QC) samples, including data quality evaluation (DQE) flags, are presented in Appendix D, Tables D-1 through D-6.

Overall, the VOC data from the LTM events met project data quality objectives (DQOs) and were determined to be sufficient to evaluate progress toward remediation goals. The laboratory analytical reports are included in Appendix E (electronic copies only). The complete DQE for 2017 LTM is provided in Appendix F. The main findings from the DQE for the MI and Dunn Field are summarized separately below.

3.2.1 Main Installation

Based on the review and the project DQOs, the MI data are acceptable and usable. No data were rejected. The primary causes of the qualified data are described below.

- A number of results for bromomethane, chloromethane, acetone, 2-chlorotoluene and/or 1,2,3-trichlorobenzene were non-detect and qualified “UJ” due to high percent difference with low response in continuing calibration standards in the April and October events. The qualified analytes are not contaminants of concern (COCs) at the MI.
- One result for acetone was detected and qualified “J-” due to a high percent difference with low response in a continuing calibration standard in the April and October events. Acetone is not a COC at the MI.
- cis-1,2-dichloroethene (cDCE) in PMW92-03-LS-25 and TCE in sample MW-259-LS-25 were qualified as estimated “J” due to low MS/MSD recoveries in the April event. Both analytes are COCs at the MI; the cis-1,2-DCE concentration in the parent sample was well below the MCL, and the TCE concentration in the parent sample was well above the MCL.
- A number of samples were qualified due to acetone in trip blanks in the April and October events. The final qualifier was 10.0 U for samples with results less than the reporting limit (RL) and qualified as non-detect at the RL. The final qualifier was “no qualification” for sample results greater than two times the blank concentration. Acetone is not a COC at the MI.
- The final qualifier for PCE in seven samples was 1.00 U due to PCE in the trip blank in the April event. The sample results were less than the RL and qualified as non-detect at the RL. PCE is a COC at the MI, with an MCL of 5 µg/L, and the qualified sample results were below this level.
- The final qualifier for all analytes in the initial sampling and analysis of PMW101-02A-LS-25 was qualified “J-“ or “UJ” due to headspace in the containers in the April event.

- The final qualifier for all analytes in sample LTM-TB3-LA-26 was UJ due to headspace in the containers in the October event.
- MTBE and PCE in sample PMW101-06A-LS-25 and its field duplicate DUP-11 were qualified “J” for field duplicate relative percent differences outside the control limit in the April event. MTBE is not a COC at the MI. PCE is a COC at the MI; the results were above the MCL.
- Any result reported below the RL but above the method detection limit was flagged “J” and considered an estimated result (unless overridden by other QC flags).

3.2.2 Dunn Field

Based on the review and the project DQOs, the Dunn Field data are acceptable and usable. No data were rejected. The primary causes of the qualified data are described below.

- A number of results for bromomethane, chloromethane and/or acetone were qualified UJ due to high percent differences with low response in continuing calibration standards in the April and October events. These analytes are not COCs at Dunn Field.
- Eleven results for acetone were detected and qualified “J-” due to a high percent difference with low response in a continuing calibration standard in the April event. Acetone is not a COC at Dunn Field.
- The final qualifiers in sample MW-08-ODLB-14 were 10.0 U for acetone and 0.300 U for chloroform due to acetone and chloroform in the equipment blank in the April event. The sample results were less than the RL and qualified as non-detect at the RL. Acetone is not a COC but chloroform is a COC at Dunn Field.
- 2,2-Dichloropropane in one sample (MW-247-ODLB-14) was qualified as non-detect estimated “UJ” and TCE in one sample (MW-130-ODLB-14) was qualified as estimated “J” due to low MS/MSD recoveries in the April event. 2,2-Dichloropropane is not a COC at Dunn Field. TCE is a COC at Dunn Field; the TCE concentration in the parent sample was well above the MCL.
- Any result reported below the RL but above the method detection limit was flagged “J” and considered an estimated result (unless overridden by other QC flags).

3.3 Main Installation Analytical Results

The complete analytical results for MI LTM groundwater samples collected in 2017 are provided in Appendix D. Summary tables for each sampling event, Tables 10 and 11, show the analytical results for the primary CVOCs and for other VOCs detected above the RL in one or more samples. The primary CVOCs for the MI are PCE, TCE, cDCE, CT, chloroform (CF) and vinyl chloride (VC). The MCLs are also listed on the summary tables.

The RL was raised for a few samples collected from MI LTM wells previously used for EBT injections; the increased RLs were due to organic content remaining in the groundwater. The RL was raised by a factor of 5 at two wells in April (MW-213 and PMW101-02A) and at one well in

October (MW-213), and by a factor of 50 at one well (DR2-5) in April and October. The number of affected wells decreased from nine in April 2016, due to decreasing organic content.

A total of 106 groundwater samples were collected for the semiannual event in April 2017. Table 10 lists the analytical results for the primary CVOCs and other VOCs detected above the RL in one or more samples.

A total of 127 groundwater samples were collected for the annual event in October 2017. Table 11 lists the analytical results for the primary CVOCs and other VOCs detected above the RL in one or more samples.

Concentration maps for the primary CVOCs exceeding MCLs are shown for the Fluvial Aquifer on Figures 14 to 20 and for the IAQ/UC on Figures 21 to 24. CVOC concentrations detected above the RL in the October 2017 samples for the MAQ wells are shown on Figure 25. PCE and TCE concentrations in Fluvial, IAQ and MAQ wells along Cross-section A from the southern MI boundary through the window to the northern MI boundary are shown on Figure 26 for October 2017.

Historical analytical results for the primary CVOCs in all MI LTM wells are provided in Appendix G. Time trend plots for MI LTM wells, where primary CVOCs were detected above MCLs in one or more samples, are provided in Appendix H.

The most recent analytical results for primary CVOCs in MI LTM wells are shown on Table 12 for Fluvial Aquifer wells and on Table 13 for IAQ/UC and MAQ wells. Results are from October 2017 for wells sampled semiannually or annually and from October 2016 for wells sampled biennially; non-detect results are not listed.

The following sections, 3.3.1 to 3.3.3, discuss the MI analytical results by aquifer, with sub-sections for each area with wells screened in that aquifer. The subsection for each area is organized in the same manner: summary information for the plume/area; comparison of isopleths and concentrations shown on the CVOC figures for April and October; the number of MCL exceedances and the maximum concentrations for the most recent sample results; and a review of historical results/trend plots.

3.3.1 Fluvial Aquifer

3.3.1.1 TTA-1 North

The TTA-1 North plume is located in the southwestern area of the MI near the central section of Building 1089 and north of former Buildings 1084 and 1085. The depth to water averages 82.1 ft bgs and the saturated thickness averages 29 ft. The groundwater flow direction is to the east-northeast. The primary contaminant prior to EBT was PCE; TCE, cDCE and VC concentrations have increased due to reductive dechlorination. EBT was implemented in the Fluvial Aquifer TTA-1 North area during EBT-1 in 2006 to 2009 and during EBT-2 in 2012 to 2014. The following LTM wells were used for injections during EBT-2: MW-21 and PMW21-01.

PCE concentrations and isopleths for April and October on Figures 14 and 15 are similar, except for increased concentrations at MW-269 and MW-278 in October. MW-278, installed in October 2016 and initially classified as a background well, was re-classified as a TTA-1N well because the PCE concentration in October 2017 (7.26 µg/L) exceeded the MCL. TCE isopleths for April and October on Figures 16 and 17 are also similar and show a smaller plume within the area of the highest PCE concentrations.

cDCE and VC concentrations for October are shown on Figures 18 and 19. High cDCE concentrations remain at the former EBT-2 IWs with lower concentrations in nearby downgradient wells. VC concentrations are limited to downgradient well MW-100B.

Fourteen fluvial LTM wells are associated with the TTA-1 North plume. The most recent analytical results for the primary CVOCs (Table 12) are summarized as follows:

- Seven wells exceeded the MCL for PCE with a maximum concentration of 270 µg/L (PMW21-04); five of these wells also exceeded the MCL for TCE with a maximum concentration of 146 µg/L (PMW21-04).
- Two wells exceeded the MCL for cDCE with a maximum concentration of 136 µg/L (MW-21), and one well exceeded the MCL for VC with a concentration of 166 µg/L (MW-100B).
- The PCE concentration in upgradient off-site well MW-269 was 70.1 µg/L in October 2017.
- Four wells located around the perimeter of the plume (MW-66A, DR1-2, DR1-7 and DR1-8) did not have CVOC concentrations above MCLs.

The following observations are based on review of the historical results and trend plots for the TTA-1 North wells:

- Three wells on the perimeter of the plume (MW-66A, DR1-2 and DR1-8) have never exceeded an MCL.
- One well, DR1-7, in the downgradient portion of the plume exceeded the MCL for PCE initially but concentrations decreased during EBT-1 and have been below MCLs since 2008.
- Three wells located upgradient of the EBT area have exceeded the MCL for PCE (MW-219, MW-269 and MW-278); the PCE concentrations are considered to represent contaminant migration from an off-site source.
    - MW-219 is located near the western MI boundary. The PCE concentration has ranged from 4.55 to 113 µg/L, with the highest concentration detected in October 2017.
    - MW-269 was installed off-site and upgradient from MW-219 in 2015; the PCE concentration has ranged from 33.6 to 70.1 µg/L, also with the highest concentration detected in October 2017.

  - MW-278 was installed off-site and upgradient from MW-269 in 2016; the PCE concentration increased to 7.26 µg/L in October 2017.

- Three wells demonstrate reductive dechlorination from one or both rounds of EBT and currently exceed MCLs for only cDCE or VC (MW-21, MW-100B and PMW21-01).
  - MW-100B had decreased PCE and TCE and increased cDCE concentrations during the EBT field trial in 2002; cDCE was then reduced to VC during EBT-1 and has remained above 100 µg/L since 2009.
  - In MW-21 and PMW21-01, concentrations of PCE and TCE decreased below the MCLs during EBT-2; cDCE concentrations increased and have remained above the MCL.
- Three wells in the central portion of the plume have shown limited effect from EBT (PMW21-02, -03 and -04).
  - PCE and TCE concentrations decreased at PMW21-02 and PMW21-03 during EBT-1 but remained above MCLs; concentrations showed no change during EBT-2 and remain at high levels.
  - PMW21-04 showed greater reductions in PCE and TCE during the two periods of EBT but concentrations rebounded after injections ended.
- PMW21-05 is located downgradient of the EBT area. The TCE concentration decreased below the MCL in 2010, after EBT-1, and remains below the MCL; the PCE concentration decreased but remains above the MCL.

3.3.1.2 TTA-1 South

The TTA-1 South plume is located a few hundred feet southeast of TTA-1 North, on the west side of Building 1088 and the southern portions of Buildings 970 and 972. Based on the distribution of PCE and TCE in the area before EBT was implemented, there appear to be two source areas. Wells in the southern area have had higher TCE concentrations and moderate PCE concentrations while those in the northern area have had higher PCE concentrations and low TCE concentrations. The depth to water averages 84.5 ft bgs and the saturated thickness averages 51.0 ft. The groundwater flow direction is to the northeast. EBT was implemented in the Fluvial Aquifer TTA-1 South area during EBT-1 in 2006 to 2009 and during EBT-2 in 2012 to 2014. The following LTM wells were used for injections during EBT-2: DR1-5/5A, DR1-6/6A and PMW101-02A/B.

PCE concentrations and isopleths for April and October on Figures 14 and 15 are similar except for a higher concentration in October at DR1-4 (8.53 µg/L) on the east side of Building 970. TCE concentrations and isopleths for April and October on Figures 16 and 17 show a larger plume in October due to an increased concentration at DR1-6A (10.5 µg/L).

cDCE and VC concentrations for October are shown on Figures 18 and 19. Elevated cDCE concentrations are shown at former EBT-2 IWs and upgradient well MW-279. VC concentrations above the RL, and MCL, are limited to PMW101-02B, PMW101-03A and PMW101-04A.

Twenty-one fluvial LTM wells are associated with the TTA-1 South plume. The most recent analytical results for the primary CVOCs (Table 12) are summarized as follows:

- Fourteen wells exceeded the MCL for PCE with a maximum concentration of 58.8 µg/L at upgradient well MW-279.
- Three wells exceeded the MCL for TCE with a maximum concentration of 22.8 µg/L at PMW101-07B.
- Two wells exceeded the MCL for VC with a maximum concentration of 4.65 µg/L at PMW101-03A.

The following observations are based on review of the historical results and trend plots for the TTA-1 South wells:

- Three wells, two on the perimeter of the plume (DR1-1 and MW-22) and one deeper well within the plume (PMW101-07A) have not exceeded an MCL; MW-22 and PMW101-07A have not had CVOCs above the RL.
- Thirteen wells had CVOC concentrations reduced during the two rounds of EBT. Generally concentrations of PCE and TCE decreased and cDCE concentrations increased during EBT and then PCE and TCE rebounded after injections ended.
    - CVOC concentrations in DR1-1A decreased during EBT-1 and have remained below MCLs since 2007.
    - PCE and TCE concentrations at PMW101-02A have been below the MCLs since 2013 except for PCE in April 2016.
    - The TCE concentration in DR1-3 increased above the MCL in 2016 and PCE concentrations in DR1-3 and DR1-4 increased above the MCL in 2017.
    - PCE concentrations rebounded above the MCL in two wells after EBT-2 ended in 2014. The October 2017 concentrations were approximately 26 µg/L in both screened intervals of MW-101 and 43.5 µg/L in PMW101-03B.
    - Three wells have had products of reductive dechlorination above MCLs. In October 2017, VC was above the MCL at PMW101-02B (4.58 µg/L) and PMW101-03A (4.65 µg/L), but decreased below the MCL at PMW101-04A (1.74 µg/L); PCE was also above the MCL in PMW101-03A (24.8 µg/L) and PMW101-04A (18.4 µg/L).
    - CVOC concentrations in three wells decreased during EBT-1 but then rebounded and had little response to EBT-2. PCE concentrations were near pre-treatment levels in the wells in October 2017: 50.7 µg/L in PMW101-04B, 11.4 µg/L in PMW101-06A and 28.5 µg/L in PMW101-06B.
    - CVOC concentrations in PMW101-07B also had little response to EBT-2. During EBT-1, concentrations decreased from 187 µg/L to 24.5 µg/L for TCE and from 53.6 µg/L to 13.3 µg/L for PCE but have decreased slowly since; October 2017 concentrations were 22.8 µg/L for TCE and 9.08 µg/L for PCE. The deeper well in this pair (PMW101-07A) has not had CVOCs above RLs.

- Four wells in the upgradient area of TTA-1 South (DR1-5/5A and DR1-6/6A) had no response to EBT-1, but PCE and TCE concentrations were reduced and cDCE concentrations increased when these wells were used for injections during EBT-2.
    - PCE concentrations in DR1-5 were reduced below the MCL in February 2014, but have been above and below the MCL since April 2016. The concentration in October 2017 was 5.12 µg/L.
    - PCE and TCE concentrations in DR1-5A rebounded above the MCL in April 2016 but have been non-detect in three samples since then.
    - PCE concentrations in DR1-6 decreased from a pre-treatment level near 250 µg/L but have remained above the MCL (8.58 µg/L in October 2017).
    - PCE and TCE concentrations in DR1-6A decreased below the MCL in November 2013, but the TCE concentration rebounded above the MCL to 10.5 µg/L in October 2017.
- MW-279 was installed upgradient of DR1-5/5A in 2016 and has been sampled only three times. The PCE concentration has been above the MCL in all three samples and was 58.8 µg/L in October 2017.

3.3.1.3 TTA-2

The TTA-2 plume is located in the southeastern area of the MI with elevated concentrations of PCE, TCE, and CT. The distribution of pre-treatment concentrations suggested two or more source areas: the highest PCE concentrations (200-250 µg/L) were observed at DR2-1 and MW-92 in the eastern area between Buildings 261 and 265; the highest CT concentrations (250 µg/L) were observed at DR2-5 and PMW85-01 in the western area, between Buildings 260 and 360; and the highest TCE concentrations (40 µg/L) were observed at MW-218 and MW-64 in the northwestern area, north of Building 360. The depth to water averages 86.8 ft bgs and the saturated thickness averages 17.4 ft. The groundwater flow direction is to the west-southwest. EBT was implemented in the Fluvial Aquifer TTA-2 area during EBT-1 in 2006 to 2009 and during EBT-2 in 2012 to 2014. The following LTM wells were used for injections during EBT-2: DR2-2, DR2-5 and PMW92-03.

Concentrations and isopleths are similar for April and October for PCE on Figures 14 and 15 and for TCE on Figures 16 and 17, except for lower concentrations in October at PMW85-05. cDCE and VC concentrations for October are shown on Figures 18 and 19; elevated cDCE concentrations remain at most TTA-2 wells in the EBT-2 area and high VC concentrations remain at several wells in the central part of the EBT-2 area, from PMW92-02 to downgradient well DR2-6.

CT concentrations for October are shown on Figure 20. Elevated CT concentrations are present at two wells (DR2-1 and MW-85) in the central TTA-2 area where EBT was implemented, but do not extend downgradient from there. However, elevated concentrations extend from MW-267 in the northwestern area of TTA-2 to MW-259 within the suspected sink; this may represent a separate contaminant source near or upgradient of MW-267.

Twenty-five fluvial LTM wells are associated with the TTA-2 plume. The most recent analytical results for the primary CVOCs (Table 12) are summarized as follows:

- Fifteen wells exceeded the MCL for PCE with a maximum concentration of 150 µg/L (DR2-1); eight of these wells also exceeded the MCL for TCE with a maximum concentration of 32.3 µg/L (MW-218).
- Five of the eight wells exceeding the MCL for PCE and TCE also exceeded the MCL for CT with a maximum concentration of 73.1 µg/L (MW-217).
- One well exceeded the MCL for cDCE with a concentration of 123 µg/L (PMW85-05), and six wells exceeded the MCL for VC with a maximum concentration of 72.2 µg/L (PMW92-02).

The following observations are based on review of the historical results and trend plots for the TTA-2 wells:

- Two wells on the perimeter of the plume (MW-50 and MW-266) have never exceeded an MCL.
- Five wells upgradient or cross-gradient (west) of the TTA-2 EBT area had no response to EBT-1 or EBT-2: MW-64, MW-88, MW-217, MW-218 and MW-267. All five wells have concentrations of PCE, TCE and/or CT above the respective MCLs.
- MW-280 was installed north of TTA-2 and upgradient of MW-267 in 2016 and has been sampled three times. The PCE concentration exceeded the MCL in April and October 2017.
- Eleven wells responded to one or both of the EBT events: DR2-1, DR2-2, DR2-5, DR2-6, MW-85, MW-92, MW-113, PMW85-01, PMW85-05, PMW92-02 and PMW92-03.
    - DR2-1 had decreased CVOC concentrations after EBT-1 but did not respond to EBT-2; concentrations are at pre-treatment levels. The other ten wells had greater responses to EBT.
    - DR2-2, which was used as an IW during EBT-2, currently has no CVOCs above MCLs.
    - DR2-5, which was also used as an IW during EBT-2, still has an elevated cDCE concentration. Elevated RLs (50 µg/L) for the 2017 samples (due to organic content and very dark purge water) are well above the MCLs for PCE, TCE, VC and CT.
    - Four wells (MW-113, PMW85-01, PMW92-02 and PMW92-03) currently exceed MCLs only for cDCE or VC, products of reductive dechlorination.
    - Three wells (DR2-6, MW-92, and PMW85-05) have cDCE or VC concentrations above the MCL but PCE, TCE and/or CT have also rebounded above the MCL.
    - MW-85 has PCE, TCE and CT concentrations above the MCLs; the VC concentration decreased below the MCL in April 2017.
- Six wells, located downgradient of the EBT area, have shown limited response to EBT: DR2-3, DR2-4, MW-25A, MW-26, MW-96 and MW-259.

- Decreasing PCE concentrations were observed at DR2-3, DR2-4, MW-25A and MW-96, but there has been no increase in cDCE concentrations. CVOC concentrations are below MCLs at MW-25A and MW-96.
- MW-259 is approximately 1,500 ft downgradient of TTA-2 and CVOC concentrations have been stable with TCE near 20 µg/L, PCE near 15 µg/L and CT near 5 µg/L.
- MW-26 near the EBT area has no clear trend with the PCE concentration ranging from 8 to 53 µg/L since 1997; the concentration was 8.25 µg/L in October 2017.

3.3.1.4 West-Central

The West-Central plume is a broad area of elevated PCE concentrations approximately 1,500 ft northeast of TTA-1. Based on pre-treatment CVOC concentrations, the plume is considered to result from contaminant migration from TTA-1 and from separate source areas in the west-central MI. The upgradient western end of the plume is east of Buildings 970 and the central area is near Building 770; the downgradient eastern end merges with the North-Central plume near Building 650 at the southern end of the window. The depth to water averages 91.2 ft bgs. The groundwater flow direction is to the east-northeast. The West-Central wells are downgradient of TTA-1 and CVOC concentrations in several wells responded to EBT-1. In addition, EBT was implemented in the West-Central area during EBT-2 in 2012 to 2014; well MW-203B was used for injections.

PCE isopleths for April and October on Figures 14 and 15 are similar; October concentrations are lower at MW-98, MW-203B and MW-207B and higher at MW-197B. TCE concentrations and isopleths on Figures 16 and 17 are similar for April and October, except for a decrease at MW-207B for October.

cDCE and VC concentrations for October are shown on Figures 18 and 19. cDCE concentrations were detected above the RL at the former EBT-2 IW, MW-203B, and several downgradient wells. VC was detected above the RL, and MCL, at MW-203B.

Fourteen fluvial LTM wells are associated with the West-Central plume. The most recent analytical results for the primary CVOCs (Table 12) are summarized as follows:

- Twelve wells exceeded the MCL for PCE and/or TCE, with maximum concentrations of 30.1 µg/L (MW-204A) for PCE and 22.2 µg/L (MW-210B) for TCE.
- One well exceeded the MCL for VC with a concentration of 5.91 µg/L (MW-203B).

The following observations are based on review of the historical results and trend plots for the West-Central wells:

- Ten wells responded to one or both EBT events: MW-39, MW-197B, MW-200, MW-203B, MW-204A/B, MW-205B, MW-206A/B and MW-210B.
  - Seven of these wells had significant reductions in PCE concentrations with concurrent increases in cDCE concentrations (MW-39, MW-197B, MW-200, MW-203B, MW-205B and MW-206A/B). MW-203B was used for injections during EBT-2.

- Decreased PCE concentrations and increased cDCE concentrations at MW-204A/B were noticeable but less than in the wells listed above. The TCE concentration in MW-204B has increased slightly over time. The limited response may be due to the well's location on the south side of the West-Central plume with less impact from EBT in TTA-1 and from injections in MW-203B.
- PCE concentrations in MW-210B decreased below the MCL, but TCE concentrations increased slightly and there was little change in cDCE concentrations.

- Four wells, located in the downgradient portion of the West-Central plume, had limited response to EBT: MW-94A, MW-98, MW-207B and MW-208B.
  - MW-94A, located on the south edge of the plume, has had a relatively stable PCE concentration at 20 to 30 µg/L.
  - MW-98, also located on the south edge of the plume, had a relatively stable PCE concentration at 30 to 40 µg/L until 2017; the PCE concentration decreased from 32.2 µg/L in October 2016 to 7.71 µg/L in October 2017; the cDCE concentration increased from 1.25 µg/L to 5.65 µg/L over the same period.
  - MW-207B and MW-208B have had varying PCE and TCE concentrations over time. During the last 3 years (2015 through 2017), PCE concentrations have been approximately 25 to 93 µg/L at MW-207B and 7 to 10 µg/L at MW-208B, and TCE concentrations have been approximately 9 to 24 µg/L at MW-207B and 2 to 12 µg/L at MW-208B.

3.3.1.5 Building 835

The Building 835 plume is an elongated area of elevated TCE concentrations near Building 835 in the western portion of the MI. The plume is oriented along the southern edge of the clay forming the window in the northwest corner of the MI; the southern end merges with the West-Central plume near Building 650. The depth to water averages 88.3 ft bgs and the saturated thickness ranges from 5 ft to 19 ft. The groundwater flow direction is to the southeast. EBT was implemented in the Fluvial Aquifer Building 835 area during EBT-2 in 2012 to 2014, with injections at MW-62 and MW-213.

TCE concentrations and isopleths for April and October on Figures 16 and 17 show an increase above the MCL at MW-213 (13.1 µg/L) and a slight decrease below the MCL at MW-142 in October.

cDCE and VC concentrations for October are shown on Figures 18 and 19. cDCE concentrations above the RL remain at the former EBT-2 IWs, MW-62 and MW-213; VC concentrations above the RL are limited to MW-62.

Eight fluvial LTM wells are associated with the Building 835 plume. The most recent analytical results for the primary CVOCs (Table 12) are summarized as follows:

- Five wells exceeded the MCL for TCE with a maximum concentration of 51 µg/L (MW-199B).

- One well exceeded the MCL for VC with a concentration of 15.3 µg/L (MW-62).

The following observations are based on review of the historical results and trend plots for the Building 835 wells:

- Three wells showed a response to EBT-2: MW-62, MW-212 and MW-213.
  - MW-62 and MW-213 were used for injections and TCE concentrations were reduced below the MCL. cDCE and VC concentrations increased in MW-62; VC currently exceeds the MCL. In MW-213, the TCE concentration rebounded in 2017 and exceeded the MCL in October.
  - The TCE concentration at MW-212, located downgradient from MW-62, decreased from 48 µg/L in 2007 to 12 µg/L in 2012, prior to EBT-2, and then decreased to 6 µg/L in 2014 with a slight increase in the cDCE concentration. The TCE concentration has risen since then to 40.1 µg/L in October 2017.
- Five wells had no apparent impact from EBT-2: MW-142, MW-143, MW-198, MW-199B and MW-209B.
  - Beginning in 2008, TCE concentrations in MW-142 and MW-143 increased from non-detect to 5 to 10 µg/L.
  - The TCE concentration at MW-198 decreased from 26 µg/L in 2007 to below the MCL in 2010.
  - The TCE concentration in MW-199B has remained stable at 50 to 100 µg/L since 2009.
  - The TCE concentration in MW-209B increased from 6 µg/L in 2007 to 34 µg/L in 2013, decreased to 3 µg/L in 2016 and increased to 8 µg/L in 2017.

3.3.1.6 North-Central

The North-Central plume is an elongated plume, which extends from the property boundary north of Building 319 to the southeast toward Building 650 where it appears to merge with the West-Central and Building 835 plumes. Elevated TCE concentrations are present throughout the plume, while PCE concentrations are limited to wells in the downgradient section beginning near MW-265. The depth to water increases from 55 ft bgs at the northern site boundary (MW-263) to 100 ft bgs in the central MI (MW-215B). The groundwater flow direction is to the southwest toward the ‘window’ or the sink in the south-central MI. EBT was not implemented in the North-Central area.

PCE isopleths for April and October on Figures 14 and 15 and TCE isopleths on Figures 16 and 17 are generally similar, with some changes in concentration; PCE concentrations in October are lower for MW-265 and higher for MW-215B and MW-281, while TCE concentrations are lower for MW-265 and higher for MW-103, MW-104 and MW-281. Consistent with the absence of EBT in this area, concentrations of cDCE (Figure 18) were very low and VC (Figure 19) was not detected.

Ten fluvial LTM wells are associated with the North-Central plume. The most recent analytical results for the primary CVOCs (Table 12) are summarized as follows:

- Four wells exceeded the MCL for PCE with a maximum concentration of 24.4 µg/L (MW-258).
- Five wells exceeded the MCL for TCE with a maximum concentration of 66.2 µg/L (MW-281). The TCE concentration in the upgradient well on the property boundary (MW-263) was 32.8 µg/L.

The following observations are based on review of the historical results and trend plots for the North-Central wells

- Two wells on the downgradient edge of the plume, MW-63A/B, have low CVOC concentrations. MW-63A has never exceeded an MCL; MW-63B has had PCE and TCE concentrations near the MCL, but usually below.
- Seven wells have had stable concentrations, generally above the MCL.
    - Three wells have TCE at elevated concentrations with PCE concentrations generally below the MCL; the TCE concentration ranges are MW-103 (5 to 10 µg/L), MW-104 (10 to 20 µg/L), and MW-263 (30 to 45 µg/L).
    - Two wells have PCE and TCE at concentrations above the MCL with PCE at higher concentrations; the concentration ranges are MW-258 (PCE at 60 to 90 µg/L and TCE at 20 to 30 µg/L) and MW-265 (PCE at 8 to 15 µg/L and TCE 5 to 8 µg/L).
    - MW-260 has had TCE concentrations from 3 to 6 µg/L.
    - MW-215B has had PCE concentrations from 4 to 7 µg/L.
- MW-281 was installed west and cross-gradient from MW-258 in 2016 and has been sampled three times. PCE and TCE concentrations exceeded the MCL in all three samples at concentrations of 8 to 15 µg/L for PCE and 50 to 66 µg/L for TCE.

3.3.1.7 South-Central

The South-Central plume is an elongated area of elevated TCE concentrations in the south-central MI. The depth to water averages 90.7 ft bgs, and the saturated thickness increases from 28 ft at MW-97 to 54 ft at MW-271. The groundwater flow direction is easterly toward the sink near MW-259. EBT was not implemented in the South-Central area.

TCE concentrations and isopleths for April and October on Figures 16 and 17 are very similar.

Five fluvial LTM wells are associated with the North-Central plume. The most recent analytical results for the primary CVOCs (Table 12) are summarized as follows:

- Two wells exceeded the MCL for TCE with a maximum concentration of 71.7 µg/L (MW-97).

The following observations are based on review of the historical results and trend plots for the South-Central wells:

- Two wells on the perimeter of the plume have not exceeded an MCL: MW-216 and MW-261.
    - Two CVOCs were detected above the RL in MW-216 in October 2008 (PCE at 34.2 µg/L and TCE at 1.5 µg/L). These results are not considered reliable because CVOCs have not been detected above RLs in the other 13 samples from MW-216 and TCE is the primary contaminant in the other South-Central wells with PCE at low concentrations below the MCL or not detected.
- Three wells have exceeded the MCL for TCE: MW-97, MW-271 and PZ-03.
    - The TCE concentration at MW-97 increased from 2 µg/L in 2004 to 71 µg/L in 2013 and have remained at 60 to 70 µg/L except for a decrease to 28 µg/L in April 2016.
    - The TCE concentration at MW-271 slightly exceeded the MCL in the initial 2015 sample and has remained slightly below 5 µg/L in later samples.
    - PZ-03 has had PCE and TCE concentrations above the MCL. The PCE concentration slightly exceeded the MCL in the initial 2002 sample and decreased over time to 1 µg/L in 2016. The TCE increased from 1 µg/L in 2010 to 15 µg/L in 2015 and has remained at that level. If the increased TCE concentration was related to the increase in MW-97, the migration time would be 6 to 7 years for the distance of 860 ft. PZ-03 could not be sampled in 2017 due to difficulty in sampling (Section 2.1); the well is planned to be abandoned with a replacement installed in 2018.

3.3.1.8 Southeast MI

Two fluvial LTM wells in the Southeast MI have elevated CVOC concentrations and are not apparently associated with designated plumes. Based on the CVOCs reported in these two wells, they do not represent a common contaminant source. The depth to water is approximately 72 ft bgs at MW-52 and 77 ft bgs at MW-270; the saturated thickness is approximately 32 ft at MW-52 and 12 ft at MW-270. The groundwater flow direction is westerly toward the sink near MW-259. EBT was not implemented in the Southeast MI area.

PCE concentrations and isopleths for April and October on Figures 14 and 15 are similar and show an isolated well (MW-52) with a concentration slightly above the MCL. TCE concentrations and isopleths for on Figures 16 and 17 are also similar and show an isolated well (MW-270) with a concentration near 25 µg/L. cDCE was also reported at MW-270 (Figure 18); based on the well location, it is not considered to be related to EBT at TTA-2.

The most recent analytical results for the primary CVOCs (Table 12) are summarized as follows:

- MW-52 exceeded the MCL for PCE with a concentration of 9.54 µg/L.
- MW-270 exceeded the MCL for TCE with a concentration of 25.5 µg/L.

The following observations are based on review of the historical results and trend plots for the Southeast MI wells:

- The PCE concentration at MW-52 has been 5 to 10 µg/L since 2002.

- The TCE concentration at MW-270 has decreased from 285 µg/L in July 2015 to 25 µg/L in 2017. cDCE is also present in the groundwater at MW-270 and exceeded the MCL in July 2015; the concentration has decreased from 122 µg/L in July 2015 to 6 µg/L in 2017.

3.3.1.9 Background

Seventeen fluvial LTM wells are located near the MI boundary with low or non-detect CVOC concentrations and are not used to define the extent of a designated plume. The wells are used to identify background concentrations. Seven wells installed for SRI Phases 1 and 2 were classified as background wells based on a limited number of samples. As noted in Section 3.3.1.1, MW-278 was initially classified a Background well, but was re-classified as a TTA-1N well based on PCE reported above the MCL in October 2017.

The most recent analytical results for the primary CVOCs (Table 12) are summarized as follows:

- No primary CVOCs were detected above MCLs.

The following observations are based on review of the historical results for the MI Background wells:

- None of the wells have had CVOCs reported above an MCL, and six wells have not had CVOCs above an RL.

3.3.2 Intermediate Aquifer/Upper Claiborne

3.3.2.1 TTA-2

One IAQ/UC well (MW-268) is installed in the area of the fluvial TTA-2 plume. The well was installed in 2015 for delineation of TTA-2 and was screened in Upper Claiborne fine sand below a clay layer.

The most recent analytical results for the primary CVOCs (Table 13) are summarized as follows:

- MW-268 did not contain CVOCs above the RLs.

The following observations are based on review of the historical results and trend plots for the IAQ/UC TTA-2 well:

- No CVOCs have been detected in the six samples from MW-268.

3.3.2.2 West-Central

Eight IAQ/UC LTM wells are installed in the area of the West-Central plume. All but MW-108 are installed in a well pair with an adjacent well screened in the Fluvial Aquifer and five of the wells (MW-39A, MW-108, MW-197A, MW-203A and MW-205A) do not have a clay layer separating the Upper Claiborne and fluvial sands. PCE and TCE from the West-Central, North-Central and Building 835 plumes intermix at the southwest end of the window. EBT was implemented in the West-Central area during EBT-2 in 2012 to 2014; well MW-203A was used for injections during EBT-2.

PCE concentrations and isopleths for April and October on Figures 21 and 22 are similar, except for slightly lower concentrations at MW-205A and MW-39A in October. TCE concentrations and isopleths on Figures 23 and 24 are also similar with slightly lower concentrations in October.

The most recent analytical results for the primary CVOCs (Table 13) are summarized as follows:

- Six wells exceeded the MCLs for PCE and/or TCE with maximum concentrations of 17.9 µg/L for PCE (MW-197A) and 19.5 µg/L for TCE (MW-207A).
- One well exceeded the MCL for VC with a concentration of 2.01 µg/L (MW-39A).
- The well used for EBT-2 injections (MW-203A) did not have CVOC concentrations above MCLs.

The following observations are based on review of the historical results and trend plots for the IAQ/UC West-Central wells:

- Five wells had significant decreases in PCE concentrations following the start of EBT-1 with some additional decrease during EBT-2: MW-39A, MW-197A, MW-205A, MW-208A and MW-210A.
    - The decrease in PCE concentrations occurred from 2008 to 2010 with initial concentrations of 230 µg/L (MW-39A) to 28 µg/L (MW-210A) reduced to 40 µg/L or lower; there were corresponding increases in cDCE and VC at some wells. During EBT-2, the PCE concentrations were reduced to 20 µg/L at most locations and below the MCL at MW-210A. TCE concentrations generally remained stable below 10 µg/L throughout the period; the TCE concentration was higher at MW-208A (10 to 20 µg/L).
    - The PCE concentration at MW-39A decreased from 23 µg/L in April 2015 to 3.93 µg/L in October 2017; TCE also decreased over this period but remained just above the MCL; and VC increased above the MCL to 2.01 µg/L in April and October 2017.
- MW-203A did not have a significant response during EBT-1, but was used as an IW for EBT-2. The PCE concentration decreased from approximately 120 µg/L in 2012 to below the MCL in 2013; no CVOCs have exceeded an MCL since 2014.
- Two wells, located in the downgradient portion of the West-Central plume, had no apparent response to EBT: MW-108 and MW-207A.
    - MW-108 has had TCE concentrations of approximately 20 to 30 µg/L since 2005, but concentrations decreased to 10 µg/L in 2017. PCE concentrations have remained near 5 µg/L since 2005.
    - MW-207A has had TCE concentrations of 20 to 50 µg/L and PCE concentrations of 10 to 20 µg/L since 2007.
- The higher TCE concentrations at MW-108, MW-207A and MW-208A are probably due to these wells being located downgradient of the Building 835 plume.

3.3.2.3 Building 835

Two IAQ/UC LTM wells (MW-199A and MW-209A) are installed in the area of the Building 835 plume. Both wells are installed adjacent to a paired well screened in the Fluvial Aquifer with a clay layer separating the Upper Claiborne and fluvial sands. TCE from the West-Central and Building 835 plumes intermix at the southwest end of the window.

TCE concentrations and isopleths for April and October on Figures 23 and 24 are similar.

The most recent analytical results for the primary CVOCs (Table 13) are summarized as follows:

- Both wells exceeded the MCL for TCE with a maximum concentration of 7.18 µg/L (MW-209A).

The following observations are based on review of the historical results and trend plots for the IAQ/UC Building 835 wells:

- Both wells had TCE concentrations below the RL or non-detect initially and then gradually increasing above the MCL.
  - The TCE concentration in MW-199A initially exceeded the MCL in October 2016.
  - The TCE concentration in MW-209A initially exceeded the MCL in October 2014; the concentration has remained below 10 µg/L.

3.3.2.4 North-Central

Four IAQ/UC LTM wells are installed in the area of the North-Central plume. MW-215A is screened in the Upper Claiborne with a sandy clay separating it from the paired well screened in the Fluvial Aquifer. MW-214A/B are a well pair with both screened in the Upper Claiborne sand and a clay separating the Upper Claiborne and fluvial sands. MW-264 was installed in 2015 for delineation of the fluvial North-Central plume; the well was screened in Upper Claiborne fine sand below a clay layer.

PCE and TCE from the West-Central and North-Central plumes intermix at the southwest end of the window. PCE concentrations and isopleths for April and October on Figures 21 and 22 are similar. TCE concentrations on Figures 23 and 24 are similar with concentrations below the MCL. The four wells were sampled in October only; the figures for April present sample results from October 2016.

The most recent analytical results for the primary CVOCs (Table 13) are summarized as follows:

- Three wells exceeded the MCL for PCE with a maximum concentration of 5.25 µg/L (MW-214A).
- MW-264 did not contain CVOCs above the RLs.

The following observations are based on review of the historical results and trend plots for the IAQ/UC North-Central wells:

- TCE and PCE concentrations in MW-214A/B have been stable since 2007, with PCE at 4 to 11 µg/L and TCE at 2 to 8 µg/L.

- The PCE concentration in MW-215A has been stable at 4 to 7 µg/L since 2007, while the TCE concentration has decreased from 6 to 2 µg/L.
- No CVOCs have been detected in the six samples from MW-264.

3.3.2.5 Window

Groundwater flow from the West-Central, Building 835 and/or North-Central plumes into the 'window' results in vertical migration of CVOCs to the IAQ and potentially the MAQ. Fifteen IAQ/UC LTM wells are adjacent to or within the 'window'.

PCE concentrations and isopleths for April and October on Figures 21 and 22 are similar, except for much lower concentrations at MW-107T/B in October; concentrations decreased from 43.1 to 8.8 µg/L at MW-107T and 50.2 to 5.43 µg/L at MW-107B. TCE concentrations on Figures 23 and 24 are similar, with concentrations below the MCL except at MW-256.

The most recent analytical results for the primary CVOCs (Table 13) are summarized as follows:

- Five wells exceeded the MCL for PCE with a maximum concentration of 27.1 µg/L at MW-141; one of these wells also exceeded the MCL for TCE with a concentration of 8.58 µg/L at MW-256.
    - MW-256 is located near the northern property boundary. No CVOCs were detected in the two IAQ wells (MW-262 and MW-273) installed west of MW-256.
- The remaining ten wells did not have CVOC concentrations above MCLs.

The following observations are based on review of the historical results and trend plots for the IAQ/UC Window wells:

- Six wells have not had CVOC concentrations above MCLs: MW-34, MW-38, MW-211, MW-229, MW-262 and MW-273.
    - Three of these wells have not had CVOCs detected above RLs: MW-229, MW-262 and MW-273.
- One well in the upgradient area of the window, MW-107, has had significant variation in PCE concentrations in samples from two screened intervals. PCE concentrations have ranged from 5 to 80 µg/L from 2011 to 2017; TCE concentrations have not exceeded the MCL during that period.
- Two wells screened in the lower section of the Upper Claiborne sand have had PCE concentrations recently increase above the MCL: MW-89 and MW-202A. PCE concentrations in both wells increased from <1 µg/L in 2009 to about 7 µg/L in October 2016; concentrations in both wells decreased below the MCL in 2017 (see Figure 26).
- Two wells have had PCE concentrations increase to relatively high concentrations over time. PCE concentrations in MW-141 increased from 6 µg/L in 2004 to 41 µg/L in October 2015 and decreased to 27 µg/L in October 2017. PCE concentrations in MW-202B increased from 6 µg/L in 2005 to 37 µg/L in October 2017. TCE concentrations in both wells have ranged from 1 to 5 µg/L. MW-141 is screened in the

lower section of the Upper Claiborne sand near the entrance to the window while MW-202B is screened in the upper section of the Upper Claiborne sand further into the window (see Figure 26).

- MW-90 has had decreasing concentrations possibly related to upgradient EBT. The PCE concentration varied from 20 to 80 µg/L from 2002 to 2011. From 2011 through 2017, the PCE concentration decreased from 30 to 14 µg/L and the TCE concentration decreased from 8 to 4 µg/L. MW-90 is screened in the upper section of the Upper Claiborne sand adjacent to MW-89 (see Figure 26).
- Two wells have had CVOC concentrations decrease below MCLs: MW-252 and MW-253.
    - The PCE concentration in MW-252 exceeded the MCL in a 2011 sample; all CVOCs have been below RLs since October 2012.
    - TCE concentrations at MW-253 increased from < 1 µg/L in 2010 to 10 µg/L in 2011; CVOCs have not been detected since 2012. The well is screened in clayey sand-clay within the Upper Claiborne. The higher TCE concentrations may have been the result of leakage from the fluvial sands during purging prior to sampling. No CVOCs have been detected in the well since MI LTM sampling transitioned to PDBs in April 2012; an adjacent well (MW-143) screened in the Fluvial Aquifer has had TCE at 7 to 13 µg/L since 2010; and the other IAQ wells in the window generally have higher concentrations of PCE.
- MW-256 is screened in the upper section of the Upper Claiborne sand in the downgradient area of the window near the northwest corner boundary of the MI. PCE and TCE concentrations increased continuously following installation in 2010 until April 2013; PCE increased from 9 to 42 µg/L and TCE increased from 2 to 16 µg/L. Concentrations have since decreased slightly to 25 µg/L for PCE and 9 µg/L for TCE.

3.3.3 Memphis Aquifer

CVOC concentrations detected above the RLs in the October 2017 samples are shown on Figure 25. Three LTM wells are identified with the MAQ for the MI; two wells (MW-254 and MW-255) are installed near the top of the Memphis Sand and one well (MW-140) is installed nearby in the lower Upper Claiborne sand (Figure 6).

The October 2017 analytical results for the primary CVOCs in the MAQ well samples are shown on Table 13; non-detect results are not listed. The results are summarized as follows:

- One well (MW-140) exceeded the MCL for PCE with a maximum concentration of 11.8 µg/L.
- Two wells did not have CVOC concentrations above MCLs.

The following observations are based on review of the historical results and trend plots for the MAQ Window wells:

- MW-254 and MW-255 have not had CVOCs above MCLs since installation in 2010.

  - MW-254 has had stable concentrations of TCE at 2 to 3 µg/L; PCE concentrations were below 1 µg/L until October 2015, but increased to 2.83 µg/L in October 2017.
  - MW-255 has had PCE and TCE concentrations below 1 µg/L, except for TCE at 1.63 µg/L in October 2016.
- The PCE concentration in MW-140 increased above the MCL in 2015, as in upgradient wells MW-89 and MW-202A which are also screened in the lower section of the Upper Claiborne sand within the window. The PCE concentration increased from <1 µg/L in 2009 to 11.8 µg/L in October 2017.

3.3.4 MCL Exceedances

The number of wells with primary CVOCs exceeding an MCL in the most recent samples is summarized by aquifer on Table 14; the maximum concentration for CVOCs exceeding MCLs in each area is also shown. The table was prepared using the results shown on Tables 12 and 13.

Concentrations exceeding the MCL for one or more of the primary CVOCs were observed in 91 of 148 MI LTM wells: 73 of 115 Fluvial Aquifer wells; 17 of 30 IAQ/UC wells and 1 of 3 MAQ wells. The most frequent exceedances were for PCE and TCE.

There were 137 MI LTM wells sampled in both October 2016 and October 2017. The number of those wells with CVOC concentrations above the MCLs in each year were similar, 84 wells in 2016 and 85 wells in 2017.

3.4 Dunn Field Analytical Results

The complete analytical results for Dunn Field LTM groundwater samples collected in 2017 are provided in Appendix D. Summary tables for each sampling event, Tables 15 and 16, show the analytical results for the primary CVOCs and for other VOCs detected above the RL in one or more samples. The primary CVOCs for Dunn Field are CT, CF, 1,1-dichloroethene (DCE), trans-1,2-dichloroethene, cDCE, 1,1,2,2-tetrachloroethane (TeCA), PCE, 1,1,1-trichloroethane (TCA), TCE, and VC. The MCLs, and TCs from the Dunn Field ROD, are also listed on the summary tables.

A total of 85 groundwater samples were collected for the biennial event in April 2017. Table 15 lists the analytical results for the primary CVOCs and other VOCs detected above the RL in one or more samples.

A total of 16 groundwater samples were collected for the semiannual event in October 2017. Table 16 lists the analytical results for the primary CVOCs and other VOCs detected above the RL in one or more samples.

Concentration maps for total CVOCs, TeCA and TCE are shown for the Fluvial Aquifer wells on Figures 27 to 32; Figures 28, 30 and 32 for October 2017 include analytical results for samples collected from monitoring wells installed by TDEC upgradient of Dunn Field. The total CVOC figures indicate extent of groundwater contamination for all primary CVOCs, some of which are detected in only a few wells. TeCA and TCE are the CVOCs historically detected at the highest

concentrations in the Dunn Field area. The concentration contours on the figures are based on the most recent analytical results for each well; only concentrations from the listed sample event are shown. The figures include 50 µg/L isopleths, where warranted, to show where the active treatment objective has not been met per the ROD Amendment, and isopleths at both the TC and MCL to show where the RAO has not been met.

CVOC concentrations detected above the RL in the April 2017 samples for the IAQ/UC wells are shown on Figure 33. The Dunn Field MAQ well (MW-67) was sampled in April 2017; CVOCs were not detected above the RLs.

Historical analytical results for the primary CVOCs in all Dunn Field LTM wells are provided in Appendix I. Time trend plots for Dunn Field LTM wells, where primary CVOCs were detected above MCLs in one or more samples, are provided in Appendix J.

The most recent analytical results for primary CVOCs in Dunn Field LTM wells are shown on Table 17 for Fluvial Aquifer wells and on Table 18 for IAQ/UC and MAQ wells. Results are from October 2017 for wells sampled semiannually and from April 2017 for wells sampled annually or biennially; non-detect results are not listed.

The following sections, 3.4.1 to 3.4.3, discuss the Dunn Field analytical results by aquifer, with sub-sections for each area with wells screened in that aquifer. The subsection for each area is organized in the same manner: summary information for the plume/area; comparison of isopleths and concentrations shown on the CVOC figures for April and October; the number of MCL exceedances and the maximum concentrations for the most recent sample results; and a review of historical results/trend plots.

3.4.1 Fluvial Aquifer

The total CVOC and TCE concentration maps on Figures 27 to 30 show the DF North plume extending across the northern section of Dunn Field to MW-79 located west of Dunn Field. These figures also show a few smaller, isolated areas of elevated concentrations in the DF West and Off Depot areas. The TeCA concentration maps on Figures 32 to 33 only show a few isolated areas exceeding the TC in the Off Depot area.

3.4.1.1 DF North

The DF North plume is located on the north end of Dunn Field and extends approximately 1,200 ft west of Dunn Field; the plume is considered to result from a suspected, off-site source(s) upgradient of Dunn Field. An on-site CVOC source area was evident in the northwest corner of Dunn Field prior to RA. The depth to water in LTM wells ranges from 45 to 66 ft bgs. The groundwater flow direction is to the west. The primary contaminants are PCE, TCE and DCE.

Findings from historical review and groundwater sampling at the TDEC wells, which are screened in the Fluvial Aquifer, were presented in a technical memorandum, *Data Collection at TDEC Wells, Dunn Field, Defense Depot Memphis, Tennessee* (HDR 2017f). The memorandum concluded that the TDEC wells were usable and provided a good network for off-site delineation of the CVOC plume migrating on to Dunn Field. The groundwater analytical results were

consistent with previous results for the TDEC wells and indicated the upgradient limits of the off-site plumes for TCE and DCE are located on the Cintas site, north of Dunn Field. Groundwater elevations and analytical results from the TDEC wells were used to prepare figures showing groundwater elevation contours and CVOC isopleth maps, but the individual TDEC wells are not discussed in this report. Additional investigation of the suspected off-site source for the DF North plume is planned.

Total CVOC and TCE concentrations and isopleths for April and October on Figures 27 to 30 are similar, except for additional data provided by the TDEC wells north of Dunn Field in October.

Fifteen fluvial LTM wells are associated with the DF North plume. The wells were identified based on location and presence of DCE in historical samples; DCE has not typically been detected in soil or groundwater samples on Dunn Field. The most recent analytical results for the primary CVOCs (Table 17) are summarized as follows:

- Eight wells exceeded the MCLs for TCE and PCE with maximum concentrations of 39.8 µg/L for TCE (MW-07) and 49.1 µg/L for PCE (MW-130); six of these wells also exceeded the MCL for DCE with a maximum concentration of 16.2 µg/L (MW-31).
- Seven wells, which are located around the perimeter of the plume, did not have CVOC concentrations above MCLs.

The following observations are based on review of the historical results and trend plots for the DF North LTM wells:

- Three wells, northwest of the plume (MW-78, MW-153 and MW-171) have had mainly non-detect concentrations since at least 2011. MW-78 and MW-153 each exceeded an MCL or TC only once in 2004. MW-171 has not exceeded an MCL or TC; CVOCs were detected above the RL for the first time in April 2017 with cDCE at 8.28 µg/L and TCE at 2.92 µg/L.
- Six wells in the northwestern corner of Dunn Field or downgradient (MW-03, MW-31, MW-68, MW-147, MW-180 and MW-220) had decreased concentrations after the FSVE system began operation in 2007 and concentrations have been relatively stable afterward. Three of the wells (MW-68, MW-147 and MW-180) have not exceeded an MCL or TC since 2008. The other three wells (MW-03, MW-31 and MW-220) have varied above and below the MCLs and TCs; MW-31 and MW-220 exceeded the MCLs for DCE, PCE and TCE in 2017.
- Six wells in the central portion of the plume (MW-07, MW-08, MW-79, MW-129, MW-130 and MW-230) have different trends but concentrations generally remain above the MCLs for DCE, PCE and TCE.
    - MW-07 has had PCE concentrations ranging from 18 to 71 µg/L since 2004.
    - Since 2012, MW-08 and MW-79 have had concentrations range from below the MCLs for DCE, PCE and TCE to 15 µg/L.

- MW-129, MW-130 and MW-230 have had decreasing concentration trends for DCE, PCE and TCE since 2009; all three CVOCs remain above the MCLs.

3.4.1.2 DF West

The DF West area incorporates the identified Source Areas on Dunn Field and was the location of the on-site RAs (IRA, Disposal Sites and Source Areas) described in Section 1.3.2. Prior to the RAs, multiple groundwater CVOC plumes originated in this area and migrated to the west. The depth to water ranges from 58 to 78 ft bgs. The groundwater flow direction is to the west. Prior to RA, the primary contaminants were TeCA, TCE and PCE.

- Total CVOC concentrations and isopleths for April and October on Figures 27 and 28 are very similar. The main area of elevated concentrations (>10 µg/L) is centered at MW-87.
- TCE concentrations and isopleths on Figures 29 and 30 are similar with concentrations slightly above the MCL at MW-57, MW-70 and MW-87 in April and at MW-57 and MW-87 in October.
- TeCA was detected above the RL in one well, MW-87, in April and October, but the concentration was below the TC.
- Only the CF concentration at MW-87 exceeded the active treatment objective of 50 µg/L for individual CVOCs.

Nineteen fluvial LTM wells are located in the DF West area. The most recent analytical results for the primary CVOCs (Table 17) are summarized as follows:

- Two wells, MW-57 and MW-87, exceeded the MCL for TCE with a maximum concentration of 8.0 µg/L (MW-87). CVOC concentrations at MW-87 also exceeded the MCL for CF with a concentration of 110 µg/L, and the TC for TCA with a concentration of 2.4 µg/L.
- CVOC concentrations in the remaining 17 wells did not exceed an MCL or TC, and concentrations in 11 wells did not exceed the RLs.

The following observations are based on review of the historical results and trend plots for the DF West LTM wells:

- All wells in the DF West area, except MW-176, had one or more CVOCs at concentrations above an MCL or TC prior to the start of FSVE operations in 2007 and the trend plots show decreased concentrations in all the wells following the start-up.
- Concentrations in all DF West wells were reduced below MCLs or TCs for all CVOCs between April 2007 and April 2012 and have remained below those limits since then, except at MW-57, MW-70 and MW-87.
    - Concentrations in MW-87 were reduced below MCLs and TCs for all CVOCs in April 2011, but began to rebound in 2013.The CF concentration increased above the TC in April 2013 and above the MCL in April 2017. The TCE concentration increased above the MCL in April 2016, and the TCA concentration increased

above the TC in October 2016. The concentrations remained above MCLs and TCs in October 2017.

- Concentrations in MW-57 were reduced below MCLs and TCs for all CVOCs in April 2012, but began to rebound in 2016. The TCE concentration exceeded the MCL in 2017; the concentration in October was 6.04 µg/L.
- Concentrations in MW-70 were reduced below MCLs and TCs for all CVOCs in October 2008, but rebounded slightly in 2017. The TCE concentration increased to 5.69 µg/L in April 2017 but decreased to 3.71 µg/L in October 2017.

3.4.1.3 Off Depot

The Off Depot area incorporates the area of groundwater contaminant plumes resulting from previous CVOC migration from DF West. The depth to water ranges from 48 to 78 ft bgs. The groundwater flow direction is to the west from the Dunn Field boundary towards a trough in groundwater elevations approximately 1,200 ft west of Dunn Field; at the trough, flow diverges to the north and south. The Off Depot area includes fluvial LTM wells on both sides of the trough. Prior to RA, the primary contaminants were TeCA, TCE and PCE.

The CVOC concentration maps show isolated areas of elevated concentrations in the Off Depot areas near MW-159, MW-144 and MW-150 (October only).

- Total CVOC concentrations and isopleths for April and October on Figures 27 and 28 are generally similar with a decreased concentration at MW-144 and increased concentrations at MW-150, MW-166/166A and MW-249 in October.
- TCE and TeCA concentrations and isopleths for April and October on Figures 29 to 32 are generally similar with decreased concentrations at MW-144 and increased concentrations at MW-150 in October.
- Only the TCE concentration at MW-159 exceeded the active treatment objective of 50 µg/L for individual CVOCs.

Thirty-four fluvial LTM wells are located in the Off Depot area. The most recent analytical results for the primary CVOCs (Table 17) are summarized as follows:

- Five wells exceeded the TC for TeCA, four of these wells exceeded the MCL for TCE, and one of these wells exceeded the TC for TCA and the MCL for VC. The highest concentration for each of the CVOCs was reported at MW-159 with TCE at 146 µg/L, TeCA at 8.36 µg/L, TCA at 3.25 µg/L and VC at 5.96 µg/L.
- One well, MW-149, exceeded the TC for CF with a concentration of 14.4 µg/L.
- CVOC concentrations in the remaining 28 wells did not exceed an MCL or TC, and concentrations in 11 wells did not exceed the RLs.

The following observations are based on review of the historical results and trend plots for the Off Depot LTM wells:

- Two fluvial Off Depot wells, MW-145 and MW-248, have never exceeded an MCL or TC. The remaining 32 wells had one or more CVOCs at concentrations above an MCL or TC

prior to the start of FSVE operations on Dunn Field in 2007. The trend plots at many Off Depot wells began to decrease after the FSVE start-up, with the timing depending on the distance from the Dunn Field boundary.

- Six fluvial Off Depot Wells had CVOC concentrations above MCLs or TCs in October 2017: MW-144, MW-149, MW-150, MW-159, MW-190 and MW-246.
    - MW-159 is located immediately upgradient of the AS/SVE system and has been the only Off Depot well to have individual CVOCs exceed the active remediation standard of 50 µg/L since April 2012. CVOC concentrations have decreased significantly due to the Dunn Field and Off Depot RAs but several CVOCs remain above MCLs or TCs, with TCE the primary contaminant at 146 µg/L in October 2017. The low concentrations reported in the April 2016 sample are not considered representative as discussed in the 2016 LTM report (HDR 2017c).
    - MW-246 is located immediately downgradient of the AS/SVE system. All CVOCs except TeCA have been below MCLs or TCs since AS/SVE operations resumed in March 2015.
    - MW-144 and MW-190 are located approximately 600 ft upgradient of the AS/SVE system. CVOC concentrations have decreased in both wells since the Dunn Field RAs were implemented but concentrations have been stable since October 2015 with TeCA above the TC and TCE above the MCL.
    - MW-150 is located near the eastern end of the AS/SVE system and downgradient of MW-144 and MW-190. Concentrations of TCE and TeCA concentrations were initially reduced below the MCL and the TC, respectively, in October 2014 and have ranged above and below since. The concentrations will likely continue that pattern as long as upgradient wells remain above MCLs or TCs.
    - MW-149 is located approximately 100 ft south of the western end of the AS/SVE system. CF, TCE and TeCA had the highest concentrations prior to remedial action. All CVOC concentrations at MW-149 were reduced below MCLs and TCs in October 2013 and remained below until October 2017 when CF was reported at 14.4 µg/L. CF concentrations have increased since October 2015, while the TCE and TeCA concentrations have been stable. Elevated CF concentrations are reported in wells from the southwest end of the Source Areas on Dunn Field (MW-87) to the south end of the AS/SVE system (MW-166/A and MW-149) and further south (MW-44, MW-249 and MW-145). The increased concentration at MW-149 is likely due to the increased concentration at MW-87 and groundwater migration to the west-northwest.

3.4.1.4 Background

The fluvial Dunn Field LTM wells located upgradient or at a distance from existing or previous contaminant plumes with no or low previous detections of primary CVOCs are considered background wells. Twelve fluvial LTM wells are identified as background wells for Dunn Field. The most recent analytical results for the primary CVOCs (Table 17) are summarized as follows:

- CVOC concentrations did not exceed an MCL or TC in any well, and concentrations in eight wells did not exceed the RLs.
- CF was detected above the RL in three wells, cDCE was detected above the RL in one well, and TCE was detected above the RL in two wells.

The following observations are based on review of the historical results for the Dunn Field Background LTM wells:

- None of the wells have had CVOCs at concentrations above an MCL or TC since 2009.
- Four wells have not had concentrations above RLs: MW-126, MW-154, MW-182 and MW-235.

3.4.2 Intermediate Aquifer/Upper Claiborne

Four LTM wells are screened in the IAQ/UC at Dunn Field. Three wells are sampled annually and one well is sampled biennially. CVOC concentrations detected above the RLs in the April 2017 samples are shown on Figure 33.

The most recent analytical results for the primary CVOCs in the IAQ/UC well samples are shown on Table 18; non-detect results are not listed. The results are listed by plume or area.

3.4.2.1 Off Depot

Three IAQ/UC wells (MW-237, MW-250 and MW-251) are installed in the Off Depot area. The most recent analytical results for the primary CVOCs (Table 18) are summarized as follows:

- No wells contained CVOC concentrations above MCLs or TCs. DCE was detected above the RL in two wells and CF was detected above the RL in one well.

The following observations are based on review of the historical results for the IAQ/UC Off Depot LTM wells:

- None of the wells have had CVOCs at concentrations above an MCL or TC. MW-250 has not had concentrations above RLs.

3.4.2.2 Background

One IAQ/UC LTM well (MW-169) is located at a background location. The most recent analytical results for the primary CVOCs (Table 18) are summarized as follows:

- MW-169 was sampled in April with no CVOC concentrations above MCLs or TCs; only cDCE was detected above the RL.

The following observations are based on review of the historical results for the IAQ/UC Off Depot LTM wells:

- MW-169 has had only cDCE detected above the RL in one sample, April 2017.

3.4.3 Memphis Aquifer

One Dunn Field LTM well (MW-67) is screened near the top of the Memphis Sand at a background location. The most recent analytical results for the primary CVOCs (Table 18) are summarized as follows:

- MW-67 was sampled in April with no CVOCs detected above RLs.

The following observations are based on review of the historical results for the IAQ/UC Off Depot LTM wells:

- MW-67 has not had CVOC concentrations above RLs.

3.4.4 MCL or TC Exceedances

The number of wells with primary CVOCs exceeding an MCL or TC in October 2017 are summarized by aquifer on Table 19; the maximum concentration for CVOCs exceeding MCLs in each area is also shown. The table was prepared using the results shown on Tables 17 and 18.

Concentrations exceeding the MCL or TC for one or more of the primary CVOCs were observed in 16 of 85 Dunn Field LTM wells. The wells with exceedances were all screened in the Fluvial Aquifer: 8 of 15 DF North wells, 2 of 19 DF West wells and 6 of 34 Off Depot wells. In 2016, there were 13 of 85 Dunn Field LTM wells with exceedances, all in the Fluvial Aquifer: 8 of 15 DF North wells, 1 of 19 DF West wells and 4 of 34 Off Depot wells.

4 Conclusions and Recommendations

4.1 Hydrogeology

- Groundwater elevations have risen throughout DDMT since 2010; the increase may be due to above average annual rainfall in 2011, 2013, 2014 and 2016 (Table C-1). While the Fluvial Aquifer wells show a relatively smooth trend (Figure C-3), the IAQ and MAQ wells also have a semiannual variation with elevations higher in the spring and lower in the fall (Figure C-4). The semiannual variation in the deeper wells is likely due to higher groundwater extraction from the MAQ in the summer and fall.
- Groundwater flow in the Fluvial Aquifer is controlled by the surface of the uppermost clay in the Upper Claiborne (Figure 13), which forms the base of the Fluvial Aquifer.
    - Fluvial Aquifer groundwater elevation contours on the MI show a window in the northwest MI and a sink in the south-central MI (Figure 8). Groundwater flow is shown as generally onto the MI from all sides with flow off the MI through vertical leakage to the IAQ, and eventually to the MAQ, at the window and the sink.
    - Fluvial Aquifer groundwater elevation contours on Dunn Field show groundwater flow is to the west toward a trough approximately 1,200 ft west of Dunn Field, where flow diverges to the north or south (Figure 8).
- Groundwater flow in the upper IAQ at the northwestern MI is to the north (Figure 10), although that is based on a few wells.
- Groundwater flow in the MAQ is to the southwest based on a few wells on the MI and Dunn Field (Figure 12). The central section of the Allen Well Field is located to the west-northwest of the MI, which suggests the hydraulic gradient should be to the west.

4.2 Analytical Results

4.2.1 Main Installation

- Analytical results were similar to results from 2016; CVOC concentrations have increased or decreased at individual wells on the MI but the number of wells exceeding an MCL are about the same. Primary CVOC concentrations exceeded the MCL in 91 of 148 MI LTM wells in 2017. At wells sampled in both 2016 and 2017, MCLs were exceeded at 84 wells in 2016 and 85 wells in 2017. Although CVOC concentrations exceed the MCLs at a large number of MI LTM wells, the concentrations are relatively low. Only 15 wells, all screened in the Fluvial aquifer, have concentrations above 50 µg/L for one or more of the original contaminants (PCE, TCE and CT); the maximum concentrations in October 2017 were 270 µg/L for PCE, 146 µg/L for TCE and 73.1 µg/L for CT.
- cDCE and VC concentrations and reduced PCE and TCE concentrations indicate reductive dechlorination is still active at several wells in areas where EBT-1 or EBT-2

was conducted (e.g. MW-62, MW-100B, MW-203B, PMW85-01, PMW92-02 and PMW101-02B)). Other wells within the EBT areas have rebounded to pre-treatment concentrations for PCE and/or TCE (e.g., DR2-1, PMW21-02, PMW21-04 and MW-92).

- CVOC concentrations in four Phase 2 SRI wells exceeded the MCLs in 2017: MW-278, MW-279, MW-280 and MW-281.
    - MW-278 was installed off-site upgradient of TTA-1N in October 2016 and classified as a background well due to low CVOC concentrations in the initial sample. The increased PCE concentration in October 2017 (7.26 µg/L) provided further support, with MW-269, for the presence of an off-site source.
    - MW-279 was installed upgradient of DR1-5/5A near the southwest boundary of the MI in 2016. The PCE concentration has been above the MCL in all three samples and was 58.8 µg/L in October 2017; the well location indicates potential impact from an off-site source.
    - MW-280 was installed north of TTA-2 and upgradient of MW-267 in 2016; the PCE concentration was 8.15 µg/L in October 2017.
    - MW-281 was installed in the North-Central area cross-gradient from MW-258 in 2016 and exceeded the MCL for PCE and TCE in all three samples. The October 2017 concentrations were 15.3 µg/L for PCE and 66.2 µg/L for TCE.
- Off-site impacts have been confirmed at TTA-1 North by off-site wells MW-269 and MW-278. Additional off-site impacts are likely based on CVOC concentrations in wells located near the property boundary: MW-279 at TTA-1S and MW-263 at the North-Central area. Planned SRI Phase 3 wells at off-site locations upgradient of the TTA-1 North, TTA-1 South and North-Central areas will be installed once access agreements are completed with the property owners.
- TCE and cDCE concentrations detected at fluvial LTM well MW-270 on the southern MI boundary continued to decrease in 2017. Only TCE exceeded the MCL in October 2017 and the concentration of 25.5 µg/L was approximately 10% of the high concentration reported in July 2015. Additional investigation in this area is planned in SRI Phase 3.
- IAQ well MW-107, which is located at the upgradient section of the ‘window’, continued to show variable PCE concentrations; the concentrations in the two screened intervals decreased from approximately 79 µg/L in October 2016 to 7 µg/L in October 2017. MW-107 was installed in 2001 to evaluate potential contamination from Building 720, a Former Fuel and Cleaners Dispensing location; additional investigation in this area is planned during SRI Phase 3.
- CVOCs in the Fluvial Aquifer have migrated vertically into the IAQ through the window in the northwestern area of the MI. PCE and TCE concentrations at IAQ well MW-256 near the northwest MI boundary continue to decrease but remain above the MCLs at 24.5 µg/L for PCE and 8.58 µg/L for TCE in October 2017 (Figure 26). Additional investigation in this area and the area of the sink in the South-Central MI is planned in SRI Phase 3.
- CVOC concentrations remain below the MCL in the two wells screened in the Memphis Sand (MW-254 and MW-255). PCE concentrations in three upgradient wells screened in lower Upper Claiborne sands (MW-89, MW-140 and MW-202A) have increased since

2009 and exceeded the MCL in 2016; PCE concentrations decreased below the MCL in October 2017 at MW-89 and MW-202A but increased to 12 µg/L at MW-140. MW-140 is grouped with the MAQ window area wells based on location and screen depth (Figure 26).

4.2.2 Dunn Field

- The DF North plume remains the most obvious feature on Dunn Field CVOC concentration maps (Figures 27 to 30); eight wells in the plume exceeded MCLs for PCE, TCE and/or DCE in 2017. The plume is considered to result from a suspected, off-site source(s) upgradient of Dunn Field. Additional investigation was conducted in 2017.
    - A membrane interface probe survey was conducted in the northeast corner of Dunn Field in March 2017. The report (Trinity 2017) concluded there was no indication of on-site source materials contributing to elevated CVOC concentrations in groundwater.
    - Groundwater samples were collected in October 2017 from ten monitoring wells installed by TDEC during previous off-site investigations. The report (HDR, 2017f) stated CVOCs were detected above the RL in four wells, but only DCE was detected above the MCL in one well (CS-02); the upgradient limits of the off-site plumes for TCE and DCE, based on concentrations above the RL, were located on the Cintas site a few hundred feet north of Dunn Field. Analytical results for the TDEC wells were used for the October 2017 CVOC concentration maps (Figures 28, 30 and 32). The scope for additional off-site investigation is being developed by Army.
- Smaller isolated plumes with CVOC concentrations above MCLs or TCs are shown on the CVOC concentration maps (Figures 27 to 32). The plumes are located around a few wells in the DF West area (MW-87/MW-06, MW-57 and MW-70) and the Off Depot area (MW-144/MW-190, MW-150 and MW-159/MW-246).
- CVOC concentrations in the DF West wells were reduced below MCLs or TCs for all CVOCs between April 2007 and April 2012, and have remained below the limits in most wells since. The exceptions are three DF West wells which exceeded an MCL or TC in 2017: MW-57, MW-70 (April only) and MW-87. Only MW-87 exceeded an MCL or TC in 2016. The increased CVOC concentrations at these wells are considered to result from residual contamination in the vadose zone. Vadose zone modeling, conducted for the Year Four FSVE report (HDR 2011b), predicted that the maximum TCE concentrations from residual TCE in the loess would be observed 4 to 5 years after system operations ceased; the FSVE was shutdown in July 2012.
- CVOC concentrations above TCs or MCLs at Off Depot wells MW-144, MW-149, MW-150, MW-159, MW-190 and MW-246 are considered to represent residual groundwater contamination resulting from migration from the Dunn Field Source Areas. The concentrations are generally decreasing over time as uncontaminated groundwater flows through the area and residual contaminated groundwater passes through the AS/SVE

treatment area. Concentrations exceeded an MCL or TC at six Off Depot wells in 2017 as compared to four wells in 2016.

- Only two wells in the DF West and Off Depot areas have CVOCs at concentrations above the active treatment objective of 50 µg/L: CF at MW-87 and TCE at MW-159.
  - Additional RA is not currently planned at MW-87 since concentrations above a TC or MCL have not been consistently observed at adjacent wells.
  - Additional AS wells are to be installed upon completion of an access agreement with MLGW. The objective is to improve remediation of CVOCs in groundwater through installation of five new AS wells targeting MW-159 (Figure 3).

4.3 Changes to LTM for 2017

Sample frequencies were reviewed based on the following criteria:

- New wells will be sampled semiannually over 2 years prior to a frequency being determined.
- Wells with stable concentrations below the MCL in the eight most recent samples will be sampled biennially.
- Wells with stable concentrations approximately two times the MCL or less will be sampled annually.
- All other wells will be sampled semiannually.
- Exceptions to the criteria will be made as appropriate:
  - The MI wells screened in the Memphis Sand (MW-254 and MW-255) have not exceeded MCLs in samples collected since installation in 2010 but will continue to be sampled annually due to increased concentrations in upgradient wells.
  - The DF North wells, which commonly exceed an MCL (MW-07, MW-08, MW-31, MW-79, MW-129, MW-130, MW-220 and MW-230), will continue to be sampled annually until the need for remedial action is determined.
  - Off Depot wells installed adjacent to the AS/SVE system for performance monitoring (MW-241 to MW-247) will be sampled more frequently than required by the new criteria in order to monitor AS/SVE performance.

The recommended 2018 LTM sample schedules are shown on Table 20 for the MI and Table 21 for Dunn Field. Changes from the 2017 sample frequencies are noted on the tables.

The sample frequencies in 2017 for MI and Dunn Field LTM wells were semiannual (102), annual (70) and biennial (61); the recommended frequencies for 2018 are semiannual (105), annual (69) and biennial (58).

Recommended 2018 sample frequencies by aquifer are:

- Main Installation
  - 114 Fluvial Aquifer - semiannual (75), annual (22) and biennial (17);
  - 30 IAQ/UC - semiannual (14), annual (11) and biennial (5); and
  - 3 MAQ - semiannual (1) and annual (2).
- Dunn Field
  - 80 Fluvial Aquifer - semiannual (15), annual (32) and biennial (33);
  - 4 IAQ/UC - annual (2) and biennial (2); and
  - 1 MAQ - biennial.

Actions to be taken in 2018:

- Abandonment of Dunn Field well MW-33 was recommended in 2015 due to difficult access; it was abandoned by Trinity ADC in October 2018.
- Abandonment of MI well MW-257 was recommended in 2016 due to damage that could not be repaired; it was abandoned by HDR in July 2018 during SRI Phase 3.
- MI well PZ-03 was recommended for replacement due to its small diameter and difficulty in sampling; no samples could be collected in 2017. PZ-03 was replaced by installation of SRI Phase 3 well MW-297 in July 2018 and will be abandoned at a later date.

Notes:
1) DO meter not functioning during sampling at MW-203B, MW-213, & MW-203A.
2) Turbidity meter did not keep calibration during sampling at MW-203A, although the water was very dark and visiually appeared to be out of range.

MI: Main Installation
DF: Dunn Field
ft, btoc: feet below top of casing
mL/min: milliliters per minute
L : liters
˚C : degrees Celsius
mg/L : milligrams per liter
mS/cm : milliSiemens per centimeter
mV :millivolts
NA : not applicable
NM : not measured
NTUs: nephelometric turbidity units
OR: out of range

Note
1. Groundwater elevations for IAQ wells MW-107 and MW-169 are shown and included to aid interpretation of elevation contours at the entrance to the window and northwest of Dunn Field. Both wells are screened in Upper Claiborne sand where a clay layer is not present below the Fluvial sand.

Responses to USEPA and TDEC Comments

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION 4
ATLANTA FEDERAL CENTER
61 FORSYTH STREET
ATLANTA, GEORGIA 30303-8960

November 29, 2018

Mr. James C. Foster
Assistant Chief of Staff for Installation Management
Base Realignment and Closure Division (ACSIM-ODB)
2530 Crystal Drive (Taylor Building), Room 5000
Arlington, VA 22202-3940

Dear Mr. Foster,

The U.S. Environmental Protection Agency (EPA) has received and reviewed the Department of Army's Responses to EPA comments for the Defense Depot of Memphis, Tennessee Annual Long Term Monitoring Report for 2017, dated April 2018, Revision 0.

EPA provides approval for the above mentioned document with the understanding that EPA requests the FFA team meet sometime at a mutually acceptable time after the SRI data has been collected and SRI activities have been concluded to discuss monitor well sampling frequency, monitor well designation and anticipated path forward for the DDMT facility.

Should you have any questions or concerns, please feel free to call me on my cell number 404-229-9500.

Sincerely,

Diedre Lloyd
Remedial Project Manager
Restoration & Sustainability Branch
Superfund Division

Mr. Thomas Holmes, HDR Environmental, P.O. Box 728, Highlands, NC 28741

Responses to:
U.S. Environmental Protection Agency (EPA) Region 4 Comments on:
Annual Long Term Monitoring Report – 2017, Revision 0
Defense Depot Memphis, Tennessee
Dated April 2018
Comments Received 28 October 2018

EPA Comments:

1. According to Table 4, 2017 Dunn Field Sample Schedule, Well MW-58 is currently classified as a fluvial background well at Dunn Field and is currently on a biennial sampling frequency. In Section 1.4. (Previous Groundwater Monitoring) on Page 1-6 states that monitoring wells classified as background wells are "… wells upgradient of or at a distance from groundwater plumes with no, or only low, previous detections of site contaminants." However, 1,1,2,2-tetrachloroethane and trichloroethene (TCE) were detected at concentrations of 0.394 (J) micrograms per liter (µg/L) and 0.727 (J) µg/L, respectively, during the most recent sample event conducted on April 23, 2017. Although these concentrations are currently below maximum contaminant levels (MCLs) it should be noted that 1,1,2,2-tetrachloroethane was last detected on April 28, 2011 at a concentration of 0.213 (J) µg/L indicating a potential increasing trend based on the data results presented in Appendix I, Historical CVOC Results - Dunn Field. Therefore, it would not be appropriate to classify MW-58 as a background well if increasing 1,1,2,2-tetrachloroethane concentrations are occurring. The biennial sampling frequency will need to be re-evaluated if the concentrations of 1,1,2,2-tetrachloroethane continue to increase.

   Response: MW-58 is located along the southwest boundary of Dunn Field, south of the Source Areas that resulted in CVOC plumes prior to remedial action The historical results for MW-58, included in Appendix I of the subject report, are attached. The well has been sampled 19 times since 1999. None of the primary CVOCs commonly detected at Dunn Field have been detected above an MCL or a Target Concentration (TC) specified in the Dunn Field Record of Decision (CH2MHILL, 2004). The highest reported concentration of TCE was 4.36 µg/L in February 2000; the highest concentration in the last four samples was 1.7 µg/L in April 2013. TeCA has been detected at estimated concentrations below the reporting limit (0.5 µg/L) in two of the last four samples, but an increase of 0.181 µg/L over four years with two non-detect (<0.5 µg/L) samples in between is not sufficient to designate an increasing trend. The well still meets the DDMT criteria for background wells, "… wells upgradient of or at a distance from groundwater plumes with no, or only low, previous detections of site contaminants."

   a. Please revise the LTM Annual Report to address these issues.

      Response: No revision is considered necessary. The well classification and sampling frequency for MW-58 will be reviewed in the 2019 LTM report after it is next sampled in April 2019. Sampling frequency will be based on the criteria listed in Section 4.3 of the subject report.

   b. Additionally, for clarity and consistency, provide the chlorinated volatile organic compound (CVOC) time-trend plot for well MW-58 in Appendix J, CVOC Time-Trend Plots Dunn Field.

      Response: Time trend plots are prepared for LTM wells that have exceeded an MCL, or a TC for Dunn Field. The historical data currently provided are considered sufficient for review of LTM wells with only low concentrations detected. No revision is considered necessary.

2. Section 4.3, Changes to LTM for 2017, states "Sample frequencies were reviewed based on the following criteria: wells with stable concentrations below the MCL in the eight most recent samples will be sampled biennially, wells with stable concentrations approximately two times the MCL or less will be sampled semiannually." Additionally, Section 4.3 states, "The sample frequencies for 2017 for MI and Dunn Field LTM wells were semiannual (102), annual (70) and biennial (61); the recommended frequencies for 2018 are semiannual (105), annual (69) and

biennial (58)." However, the LTM Annual Report does not specifically note which wells will be placed on a different sampling frequency.

Response: As a clarification, the criteria in Section 4.3 states "…wells with stable concentrations approximately two times the MCL or less will be sampled annually", not semiannually.

a. For clarity and consistency and prior to approval of any modifications of sampling frequency, please revise the LTM Annual Report to identify the wells where the frequency has changed and provide the criteria or rationale for the change.

   Response: The revised sample frequencies in the subject report were implemented in 2018 as there were a limited number of changes which resulted in an overall increase in sample frequency.

   Tables 20 and 21 of the subject report will be revised to add a column noting the prior frequency, if changed. The second sentence of the following paragraph will be added: "The recommended 2018 LTM sample schedules are shown on Table 20 for the MI and Table 21 for Dunn Field. Changes from the 2017 sample frequencies are indicated on the tables."

TDoR MEFO: file 79-736

The *Supplemental Remedial Investigation Phases 1 and 2 Report, Revision 0* (HDR 2017d) was submitted to USEPA and TDEC for review in November 2017. Conclusions from document review addressed hydraulic connections between the Fluvial Aquifer and the MAQ in the Memphis area and at DDMT; limits to natural attenuation of CVOCs in groundwater at DDMT due to low natural carbon and high dissolved oxygen in groundwater; and findings from the 2009 groundwater model (HDR|e^{2}M 2010). Conclusions from the field investigation addressed site hydrogeology and plume delineation.

Additional work is planned to complete the SRI, with concurrence from USEPA and TDEC, in order to provide sufficient information for evaluation of remedial alternatives in the FFS and to develop a successful strategy for RA. The *Supplemental Remedial Investigation Phase 3 QAPP* (HDR 2017e) was submitted to USEPA and TDEC on 7 November 2017.

1.3.2 Dunn Field

The *Record of Decision for Interim Remedial Action of the Groundwater at Dunn Field (OU-1)* (CH2M HILL 1996) was signed in April 1996 with the objective of hydraulic containment to prevent further contaminant plume migration and reduce contaminant mass in groundwater. The interim remedial action (IRA) groundwater recovery system included 11 recovery wells (RWs) screened in the Fluvial Aquifer along the western boundary of Dunn Field. Based on reduction of CVOC concentrations in groundwater following implementation of the Dunn Field Source Areas RA, five RWs were shutdown in June 2008 and the remaining RWs were shutdown in January 2009. The IRA system was removed and the RWs abandoned in July 2010.

The groundwater RAOs established in the *Memphis Depot Dunn Field Record of Decision* (Dunn Field ROD) (CH2M HILL 2004b) are:

- to prevent human exposure to contaminated groundwater (i.e., exceeding protective target concentrations [TC])
- to prevent further off-site migration of VOCs in excess of protective target levels
- to remediate Fluvial Aquifer groundwater to drinking water quality to be protective of the deeper MAQ.

The remedies were implemented in three phases: Disposal Sites, Source Areas and Off Depot. The selected remedies for the Source Areas and Off Depot were modified through the *Dunn Field Record of Decision Amendment* (ROD Amendment) (e^{2}M 2009) approved in January 2009.

The Disposal Sites RA included excavation and off-site disposal of soil and waste material from five sites and was completed in 2006. The *Dunn Field Disposal Site Remedial Action Completion Report* (MACTEC 2006) was approved by USEPA in August 2006.

The Source Areas RA was to include soil vapor extraction (SVE) in the vadose zone and injection of zero valent iron (ZVI) in groundwater. The Fluvial SVE (FSVE) in fluvial soils (30 to 70 ft bgs) was operated from July 2007 to July 2012 and removed approximately 4,000 pounds of VOCs. Thermal SVE, or in situ thermal desorption, was implemented in the loess (0 to 30 ft

Summary of Comments on LTM Annual Report - 2017 Rev0.pdf

Page: 12

Number: 1 Author: BG38123 Subject: Highlight Date: 10/19/2018 12:55:29 PM
Wasn't there an RAO for VI on Dunn Field? (or is that represented by the second bullet)

Response:
These are Groundwater RAOs from the ROD; there was a vapor-related RAO for sub-surface soil:
"Prevent direct inhalation of indoor air vapors from subsurface soils in excess of industrial worker criteria."

The RGs in the ROD (Table 2-21G) include Protective Soil Vapor Concentrations as well as Groundwater Target Concentrations and Site-Specific Soil Screening Levels to be Protective of Groundwater. Shut down of the Fluvial SVE system was based on reduction of CVOCs concentrations in vapor and groundwater samples and final soil samples below the RGs. The final vapor samples (Year 5 report, Tables 6-10) from SVE wells screened in the fluvial sand/gravel deposits exceeded the vapor RGs at most locations. VI sampling prior to development would be warranted.

Since this is an LTM (groundwater) report with no vapor samples collected, limiting discussion to groundwater RAOs and results is appropriate.
No revision necessary.

bgs) from May to December 2008 and removed approximately 12,500 pounds of VOCs. ZVI injection was not required due to the success of SVE in reducing groundwater impacts. Excavation and off-site disposal of soil and waste material were also conducted in two additional areas; the work was performed in two phases, October 2007 to January 2008 and February to June 2009, so as not to interfere with thermal SVE implementation. The *Dunn Field Source Areas Interim Remedial Action Completion Report, Revision 1* (Source Areas IRACR) (HDR|e^{2}M 2009) was approved by USEPA and TDEC in November 2009.

The FSVE system was shut down in July 2012 after meeting soil remediation goals; LTM results at nearby wells are evaluated for potential rebound in CVOC concentrations. The FSVE system and nearby LTM wells are shown on Figure 2.

The Off Depot RA included installation of an air sparging with SVE (AS/SVE) system with 90 AS points and 12 SVE wells; operations began in December 2009. AS/SVE in combination with natural attenuation processes is expected to reduce groundwater concentrations to MCLs in accordance with the RAOs in the Dunn Field ROD. The AS/SVE system with nearby LTM wells is shown on Figure 3. The *Dunn Field Off Depot Groundwater Interim Remedial Action Completion Report, Revision 1* (Off Depot IRACR) (HDR 2011a) was approved by USEPA in August 2011 and by TDEC in November 2011.

Overall performance of the AS/SVE system is evaluated based on results of LTM analyses. The AS/SVE system was installed to intercept the majority of the Off Depot CVOC plume and to reduce individual CVOC concentrations below 50 µg/L. Operations are to continue until the upgradient concentrations from the Dunn Field plume do not exceed 50 µg/L for individual CVOCs in upgradient wells. Since April 2012, only TCE in one LTM well near the AS/SVE system, MW-159, has exceeded the 50 µg/L objective.

The latest annual report, *Off Depot Air Sparge-Soil Vapor Extraction System Annual Operations Report, Year Six, Revision 0* (HDR 2017b), was submitted to USEPA and TDEC in August 2017. The AS/SVE system has removed approximately 86 pounds of VOCs through April 2017. In order to address the continued high concentration of TCE at MW-159, additional AS wells will be installed south of MW-159 to increase removal of CVOCs from groundwater. The new AS wells will be installed upon completion of an updated access agreement with MLGW and will be incorporated into system operations following installation. Since the active remediation goal of CVOC concentrations at 50 µg/L (or less) has not been met, operations are planned to continue through May 2019.

1.4 Previous Groundwater Monitoring

The *Annual Long-Term Monitoring Report-2016, Revision 1* (HDR 2017c) was approved by TDEC in June and by USEPA in October 2017. During preparation of the report, the well classifications in the LTM plan were reviewed in response to suggestions from USEPA and the BRAC Environmental Coordinator. The LTM plans for the MI and Dunn Field were prepared in 2004 and 2008, respectively. Information on site hydrogeology and contaminant extent at DDMT has increased significantly since that time, especially for the MI where approximately 100 LTM wells have been installed since the LTM plan was completed. Based on the review, well

Page: 13

Number: 1 Author: BG38123 Subject: Highlight Date: 10/19/2018 12:54:00 PM
Maybe a targeted injection at this point (May 2019) should be considered if no considerable up-tick in plume concentrations or SVE recovery amounts are observed. I know the MLGW access agreement is the hold up, but maybe they will be more willing to grant access under the context of AS/SVE system decommissioning and removal (piping, well close-outs, ops building & equipment)..just a thought

Response:
Alternative remedial strategies will be considered, but no action can be performed until MLGW responds to Army requests for access. At present, it is not clear what issues MLGW has with the draft agreement.

No revision necessary.

classifications were revised from the initial purpose-based criteria (background, boundary, sentinel and performance) to classification by aquifer and plume/area.

LTM wells were assigned to the Fluvial, Intermediate or Memphis Aquifers. The upper clay layer in the Upper Claiborne, which usually forms the base of the Fluvial Aquifer, is absent in the central part of the MI, and the Fluvial sand and the Upper Claiborne sand form a single water table aquifer. Several deeper wells in this area are designated Upper Claiborne and are grouped with the IAQ wells.

In addition to classification by aquifer, the wells are grouped by area or plume. The areas for MI LTM wells are: TTA-1 North, TTA-1 South, TTA-2, West-Central, Building 835, North-Central, South-Central, Southeast MI and Background. The areas for Dunn Field LTM wells are: DF North, DF West, Off Depot and Background. The Background wells at the MI and Dunn Field were selected based on criteria in the LTM Plans (wells upgradient of or at a distance from groundwater plumes and with no, or low, previous detections of site contaminants).

The 2016 LTM report also included review and revision of the sample frequencies for LTM wells. The following criteria were established:

- New wells will be sampled semiannually over 2 years prior to a frequency being determined.
- Wells with stable concentrations below the MCL in the eight most recent samples will be sampled biennially.
- Wells with stable concentrations approximately two times the MCL or less will be sampled annually.
- All other wells will be sampled semiannually.
- The following exceptions to the criteria will be made:
  - The MI MAQ wells have not exceeded MCLs in samples collected since installation in 2010 but will continue to be sampled annually due to increased concentrations in upgradient wells.
  - The DF North wells exceeding an MCL will continue to be sampled annually until the need for remedial action is determined.
  - Off Depot wells adjacent to the AS/SVE system will be sampled more frequently than required by the new criteria in order to monitor AS/SVE performance.

Page: 14

Number: 1 Author: BG38123 Subject: Highlight Date: 10/19/2018 11:57:44 AM
Is there any place which specifies the mw's for these criteria exceptions? (separately from Tables 3 & 4)

Response:
Wells are identified by aquifer and area for the MI on Tables 1, 3, 12/13 and 20, and for Dunn Field on Tables 2, 4, 18/19 and 21. Well are discussed by aquifer and area in Section 3.3 for the MI and 3.4 for Dunn Field.

The text will be revised as follows:
The MI wells installed in the Memphis Sand (MW-254 and MW-255) have not exceeded ....
The DF North wells, which commonly exceed an MCL (MW-07, MW-08, MW-31, MW-79, MW-129, MW-130, MW-220 and MW-230), will continue to be ....
Off Depot wells installed adjacent to the AS/SVE system for performance monitoring (MW-241 to MW-247) will be considered for more frequent sampling than required by the criteria ...

(DUP-8-LA-26) at one of the wells. The trip blank could not be recollected and the analysis was performed with an affected vial.

The height of the PVC well casing in MI LTM well MW-210B did not allow the manhole cover to fit properly, and the cover appeared to have been damaged during recent mowing; the PDB in the well did not appear to be damaged and was used during sampling. The well casing was cut down by less than one inch and a new well cover was installed on 11 October, and the top of casing (TOC) was re-surveyed by Allen & Hoshall, a registered land surveyor, on 12 October. A discrepancy was noted during HDR's review of the new elevation data; the new TOC elevation was higher than the previous elevation even though the TOC had been lowered. Allen & Hoshall determined that a transposed number in the control point elevation had been used during their initial elevation survey in 2007 following installation of the wells; the horizontal coordinates were not affected. Allen & Hoshall recalculated the elevations for the affected wells; their report is included in Appendix B. The corrected elevations differ from the initial 2007 elevations by less than 0.5 ft. Some of the wells had their top of casing modified and elevations re-surveyed in 2013; the 2013 survey data did not require revision. Groundwater elevations based on the corrected TOC elevations were more consistent with adjacent wells than those based on the original 2007 TOC elevations. Groundwater elevations and contour maps for the MI are discussed in Section 3.1.1.2.

2.1.2.1 Main Installation

Annual groundwater sampling was conducted on 7 to 12 October 2017 with samples collected from 125 of 126 designated wells; a sample could not be collected from PZ-03, as noted above. There were 127 groundwater samples collected; samples were collected from two screened intervals at MW-101 and MW-107.

Groundwater samples were collected from 121 wells using PDBs, but samples from two wells (DR1-6A and MW-203A) were not usable as noted above. The PDB sample depths are shown on Table 7.

Three wells with PDBs previously installed (MW-203B, MW-274 and MW-283) were sampled using a portable bladder pump with dedicated tubing and bladder. The PDB in MW-203B appeared to be damaged and was not used; the PDB tethers for MW-274 and MW-283 were switched during installation and the PDBs were not at appropriate depths for sampling. Two wells were purged and sampled with a bailer: DR2-5 and MW-213. DR2-5 was bailed dry and sampled after the water level recovered on the same day, 10 October. MW-213 was sampled with a bailer due to limited saturated thickness. DR1-6A and MW-203A were re-sampled on 11 and 12 October, respectively; new bailers were used because dedicated bladders and tubing were not available and could not be obtained before the sample event ended. DR1-6A, MW-203A and MW-213 were sampled after at least three well volumes were purged. The final stabilization measurements are shown on Table 8.

2.1.2.2 Dunn Field

Semiannual groundwater sampling was conducted on 5 and 6 October 2017 with samples collected from 16 wells. There are 13 Dunn Field LTM wells identified for semiannual sampling

good to hear

Response:
Comment received. No revision necessary.

was conducted (e.g. MW-62, MW-100B, MW-203B, PMW85-01, PMW92-02 and PMW101-02B)). Other wells within the EBT areas have rebounded to pre-treatment concentrations for PCE and/or TCE (e.g. DR2-1, PMW21-02, PMW21-04 and MW-92).

- CVOC concentrations in four Phase 2 SRI wells exceeded the MCLs in 2017: MW-278, MW-279, MW-280 and MW-281.
    - MW-278 was installed off-site upgradient of TTA-1N in October 2016 and classified as a background well due to low CVOC concentrations in the initial sample. The increased PCE concentration in October 2017 (7.26 µg/L) provided further support, with MW-269, for the presence of an off-site source.
    - MW-279 was installed upgradient of DR1-5/5A near the southwest boundary of the MI in 2016. The PCE concentration has been above the MCL in all three samples and was 58.8 µg/L in October 2017; the well location indicates potential impact from an off-site source.
    - MW-280 was installed north of TTA-2 and upgradient of MW-267 in 2016; the PCE concentration was 8.15 µg/L in October 2017.
    - MW-281 was installed in the North-Central area cross-gradient from MW-258 in 2016 and exceeded the MCL for PCE and TCE in all three samples. The October 2017 concentrations were 15.3 µg/L for PCE and 66.2 µg/L for TCE.
- Off-site impacts have been confirmed at TTA-1 North by off-site wells MW-269 and MW-278. Additional off-site impacts are likely based on CVOC concentrations in wells located near the property boundary: MW-279 at TTA-1S and MW-263 at the North-Central area. Additional investigation in these three areas is planned in SRI Phase 3.
- TCE and cDCE concentrations detected at fluvial LTM well MW-270 on the southern MI boundary continued to decrease in 2017. Only TCE exceeded the MCL in October 2017 and the concentration of 25.5 µg/L was approximately 10% of the high concentration reported in July 2015. Additional investigation in this area is planned in SRI Phase 3.
- IAQ well MW-107, which is located at the upgradient section of the ‘window’, continued to show variable PCE concentrations; the concentrations in the two screened intervals decreased from approximately 79 µg/L in October 2016 to 7 µg/L in October 2017. MW-107 was installed in 2001 to evaluate potential contamination from Building 720, a Former Fuel and Cleaners Dispensing location; additional investigation in this area is planned during SRI Phase 3.
- CVOCs in the Fluvial Aquifer have migrated vertically into the IAQ through the window in the northwestern area of the MI. PCE and TCE concentrations at IAQ well MW-256 near the northwest MI boundary continue to decrease but remain above the MCLs at 24.5 µg/L for PCE and 8.58 µg/L for TCE in October 2017 (Figure 26). Additional investigation in this area and the area of the sink in the South-Central MI is planned in SRI Phase 3.
- CVOC concentrations remain below the MCL in the two wells screened in the Memphis Sand (MW-254 and MW-255). PCE concentrations in three upgradient wells screened in lower Upper Claiborne sands (MW-89, MW-140 and MW-202A)have increased since

Number: 1 Author: BG38123 Subject: Highlight Date: 10/19/2018 12:46:59 PM
Sounds like another potential site for the EPA/State PA/SI program. I will inform the State Program Manager regarding the issue.

Response:
TDEC PA/SI in these areas would be helpful.

The wells were not installed during Phase 3 because access was not granted prior to SRI Phase 3 field work. Access has been granted for 3 of the 4 planned locations; access at the final Fluvial well location is being discussed with the property owner.

Text will be revised to state "Planned SRI Phase 3 wells at off-site locations upgradient of the TTA-1 North, TTA-1 South and North-Central areas will be installed once access agreements are completed with the property owners."

treatment area. Concentrations exceeded an MCL or TC at six Off Depot wells in 2017 as compared to four wells in 2016.

- Only two wells in the DF West and Off Depot areas have CVOCs at concentrations above the active treatment objective of 50 µg/L: CF at MW-87 and TCE at MW-159.
  - Additional RA is not currently planned at MW-87 since concentrations above a TC or MCL have not been consistently observed at adjacent wells.
  - Additional AS wells are to be installed upon completion of an access agreement with MLGW. The objective is to improve remediation of CVOCs in groundwater through installation of five new AS wells targeting MW-159 (Figure 3).

4.3 Changes to LTM for 2017

Sample frequencies were reviewed based on the following criteria:

- New wells will be sampled semiannually over 2 years prior to a frequency being determined.
- Wells with stable concentrations below the MCL in the eight most recent samples will be sampled biennially.
- Wells with stable concentrations approximately two times the MCL or less will be sampled annually.
- All other wells will be sampled semiannually.
- Exceptions to the criteria will be made as appropriate:
  - The MI MAQ wells have not exceeded MCLs in any samples since the wells were installed in 2010; the wells will continue to be sampled annually due to increased concentrations in upgradient wells.
  - The DF North wells exceeding an MCL will continue to be sampled annually until the need for remedial action is determined.
  - Off Depot wells adjacent to the AS/SVE system will be sampled more frequently than required by the new criteria in order to monitor AS/SVE performance.

The recommended 2018 LTM sample schedules are shown on Table 20 for the MI and Table 21 for Dunn Field.

The sample frequencies in 2017 for MI and Dunn Field LTM wells were semiannual (102), annual (70) and biennial (61); the recommended frequencies for 2018 are semiannual (105), annual (69) and biennial (58).

Recommended 2018 sample frequencies by aquifer are:

- Main Installation
  - 114 Fluvial Aquifer - semiannual (75), annual (22) and biennial (17);
  - 30 IAQ/UC - semiannual (14), annual (11) and biennial (5); and

Re: Memphis Depot Monitoring Well corrections.

Dear Mr. Holmes,

Please see the attached tabulated data of a series of monitoring wells located in May, 2007 that were found to have contained errors in the elevations originally reported. The tabulated data shows a list of the affected wells, original data and corrected data.

In October of 2017, we were asked to survey in a well that had been recently repaired. This well, MW-210B, was originally surveyed by us in May of 2007. In comparing the new elevation data the original elevation data, we discovered an error in the original 2007 data. This error was discovered to been caused by a transposition of numbers in the original level notes of May, 2007. A thorough review of all the data from the original field book notes showed this error to have been propagated throughout several of the well elevations reported from that level run.

As such, the data from the May, 2007 level run has been corrected and tabulated on the attached spreadsheet.

I apologize for the error and have taken internal steps to ensure the error does not happen again.

Sincerely,
Allen&Hoshall, Inc.

James B. Caughman, RLS
Land Surveyor.

Analytical Reports

Microbac

Laboratory Report Number: L17041069 *(Revised)*

Revised report to include the ICAL/ICV forms.
Revised report to re-scan the COCs forms that did not pull into the original scan.
Revised report to remove 1,4 Dioxane.

Diane Short & Associates
CT Laboratories
1978 S. Garrison St
Lakewood, CO 80227

Please find enclosed the analytical results for the samples you submitted to Microbac Laboratories. Review and compilation of your report was completed by Microbac's Ohio Valley Division (OVD). If you have any questions, comments, or require further assistance regarding this report, please contact your service representative listed below.

Laboratory Contact:
Michelle Taylor – Client Services Specialist
(740) 373-4071
Michelle.Taylor@microbac.com

I certify that all test results meet all of the requirements of the accrediting authority listed below. All results for soil samples are reported on a 'dry-weight' basis unless specified otherwise. Analytical results for water and wastes are reported on a 'as received' basis unless specified otherwise. A statement of uncertainty for each analysis is available upon request. This laboratory report shall not be reproduced, except in full, without the written approval of Microbac Laboratories. The reported results are related only to the samples analyzed as received.

This report was certified on July 25 2017

Leslie Bucina – Managing Director

Record of Sample Receipt and Inspection

Comments/Discrepancies

This is the record of the shipment conditions and the inspection records for the samples received and reported as a sample delivery group (SDG). All of the samples were inspected and observed to conform to our receipt policies, except as noted below.

There were no discrepancies.

Discrepancy	Resolution

Coolers

Cooler #	Temperature Gun	Temperature	COC #	Airbill #	Temp Required?
00114306	H	3.0		1001891733010004575000778957073418	X
0019634	H	3.0		1002826033010004575000778957073223	X

Inspection Checklist

#	Question	Result
1	Were shipping coolers sealed?	Yes
2	Were custody seals intact?	Yes
3	Were cooler temperatures in range of 0-6?	Yes
4	Was ice present?	Yes
5	Were COC's received/information complete/signed and dated?	Yes
6	Were sample containers intact and match COC?	Yes
7	Were sample labels intact and match COC?	Yes
8	Were the correct containers and volumes received?	Yes
9	Were samples received within EPA hold times?	Yes
10	Were correct preservatives used? (water only)	Yes
11	Were pH ranges acceptable? (voa's excluded)	NA
12	Were VOA samples free of headspace (less than 6mm)?	Yes

1.0 Summary Data

1.1 Narratives

Login Number: L17041069
Department: Volatiles
Analyst: Jared Smith

METHOD

Preparation SW-846 5030C/5035A

Analysis SW-846 8260B

HOLDING TIMES

Sample Preparation: All holding times were met.

Sample Analysis: All holding times were met.

PREPARATION

Sample preparation proceeded normally.

CALIBRATION

Initial Calibration: For all compounds that yielded a %RSD greater than 15%, linear or higher order equations were applied. All acceptance criteria were met.

Alternate Source Standards: All acceptance criteria were met.

Continuing Calibration and Tune: Bromomethane was below the LCL in CCV WG611068-02 analyzed 04/21/2017 on HPMS6, Chloromethane was below the LCL in CCV WG611143-02 analyzed 04/21/2017 on HPMS11, 1,2,3-Trichlorobenzene was below the LCL in CCV WG611221-02 analyzed 04/22/2017 on HPMS6, Bromomethane exceeded the UCL in CCV WG611300-02 analyzed 04/24/2017 on HPMS8. All other acceptance criteria were met. Please see the applicable QC report for a detailed presentation of the failures.

BATCH QA/QC

Method Blank: All acceptance criteria were met.

Laboratory Control Sample: All acceptance criteria were met.

Matrix Spikes: MS/MSD performed on sample 26 has recoveries out of range for 2,2-Dichloropropane and

Trichloroethene, and RPD results outside control limits for 2,2-Dichloropropane. MS/MSD performed on sample 07 has recoveries out of range for cis-1,2-Dichloroethene. All other acceptance criteria were met.

SAMPLES

Internal Standards: All acceptance criteria were met.

Surrogates: All acceptance criteria were met.

Other: Samples 13, were run at a dilution.

Manual Integration Reason Codes

Reason #1: Data System Fails to Select Correct Peak. In some cases the chromatography system selects and integrates the 'wrong peak'. In this case the analyst must correct the selection and force the system to integrate the proper peak. Other times the system may miss the peak completely.

Reason #2: Data System Splits the Peak Incorrectly or Integrates a False Peak as a Rider Peak. This phenomena is common at low concentrations where the signal:noise ratio is low. A single compound (peak) is incorrectly split into multiple peaks or integrated as a main peak with one or more rider peaks resulting in low area counts for the target compound.

Reason #3: Improperly Integrated Isomers and/or coeluting compounds. This system often fails to distinguish coeluting compounds and or isomers. The integration areas and concentrations are wrong, and they must be corrected by manual integration. Prime examples are benzo(k)fluoranthene and benzo(b)fluoranthene which are often unresolved and integrated improperly when both are present at low concentrations in standards or samples.

Reason #4: System Establishes Incorrect Baseline. There are numerous situations in chromatography where the system establishes the baseline incorrectly. Some baseline errors will be obvious to the analyst and should be corrected via manual procedures.

Reason #5: Miscellaneous. Other situations involving integration errors may require in-depth review and technical judgment. These cases should be brought to the attention of the laboratory management. If the form of manual integration is not clearly covered by these four cases, then review and approval by the Managing Director or the QAO will be required.

I certify that this data package is in compliance with the terms and conditions agreed to by the client and Microbac Laboratories Inc., both technically and for completeness, except for the conditions noted above. Release of the data contained in this hard copy data package has been authorized by the Laboratory Manager or designated person, as verified by the following signature.

Dibromofluoromethane	99.7	85	115	
1,2-Dichloroethane-d4	103	72	119	
Toluene-d8	106	81	120	
4-Bromofluorobenzene	104	76	119	

F	Found; the analyte was positively identified with concentration above MDL but below RL.
J	The analyte was positively identified, but the quantitation is an estimate.
U	Undetected; the analyte was analyzed for, but not detected.

Toluene-d8	106	81	120	
4-Bromofluorobenzene	105	76	119	

F	Found; the analyte was positively identified with concentration above MDL but below RL.
Q	One or more quality control criteria failed. See narrative.
U	Undetected; the analyte was analyzed for, but not detected.

Lab Contact: Michelle Taylor

Certificate of Analysis

2.0 Full Sample Data Package

2.1 Volatiles Data

2.1.1 Volatiles GCMS Data (8260)

2.1.1.1 Summary Data

Login Number: L17041069
Department: Volatiles
Analyst: Jared Smith

METHOD

Preparation SW-846 5030C/5035A

Analysis SW-846 8260B

HOLDING TIMES

Sample Preparation: All holding times were met.

Sample Analysis: All holding times were met.

PREPARATION

Sample preparation proceeded normally.

CALIBRATION

Initial Calibration: For all compounds that yielded a %RSD greater than 15%, linear or higher order equations were applied. All acceptance criteria were met.

Alternate Source Standards: All acceptance criteria were met.

Continuing Calibration and Tune: Bromomethane was below the LCL in CCV WG611068-02 analyzed 04/21/2017 on HPMS6, Chloromethane was below the LCL in CCV WG611143-02 analyzed 04/21/2017 on HPMS11, 1,2,3-Trichlorobenzene was below the LCL in CCV WG611221-02 analyzed 04/22/2017 on HPMS6, Bromomethane exceeded the UCL in CCV WG611300-02 analyzed 04/24/2017 on HPMS8. All other acceptance criteria were met. Please see the applicable QC report for a detailed presentation of the failures.

BATCH QA/QC

Method Blank: All acceptance criteria were met.

Laboratory Control Sample: All acceptance criteria were met.

Matrix Spikes: MS/MSD performed on sample 26 has recoveries out of range for 2,2-Dichloropropane and

Trichloroethene, and RPD results outside control limits for 2,2-Dichloropropane. MS/MSD performed on sample 07 has recoveries out of range for cis-1,2-Dichloroethene. All other acceptance criteria were met.

SAMPLES

Internal Standards: All acceptance criteria were met.

Surrogates: All acceptance criteria were met.

Other: Samples 13, were run at a dilution.

Manual Integration Reason Codes

Reason #1: Data System Fails to Select Correct Peak. In some cases the chromatography system selects and integrates the 'wrong peak'. In this case the analyst must correct the selection and force the system to integrate the proper peak. Other times the system may miss the peak completely.

Reason #2: Data System Splits the Peak Incorrectly or Integrates a False Peak as a Rider Peak. This phenomena is common at low concentrations where the signal:noise ratio is low. A single compound (peak) is incorrectly split into multiple peaks or integrated as a main peak with one or more rider peaks resulting in low area counts for the target compound.

Reason #3: Improperly Integrated Isomers and/or coeluting compounds. This system often fails to distinguish coeluting compounds and or isomers. The integration areas and concentrations are wrong, and they must be corrected by manual integration. Prime examples are benzo(k)fluoranthene and benzo(b)fluoranthene which are often unresolved and integrated improperly when both are present at low concentrations in standards or samples.

Reason #4: System Establishes Incorrect Baseline. There are numerous situations in chromatography where the system establishes the baseline incorrectly. Some baseline errors will be obvious to the analyst and should be corrected via manual procedures.

Reason #5: Miscellaneous. Other situations involving integration errors may require in-depth review and technical judgment. These cases should be brought to the attention of the laboratory management. If the form of manual integration is not clearly covered by these four cases, then review and approval by the Managing Director or the QAO will be required.

I certify that this data package is in compliance with the terms and conditions agreed to by the client and Microbac Laboratories Inc., both technically and for completeness, except for the conditions noted above. Release of the data contained in this hard copy data package has been authorized by the Laboratory Manager or designated person, as verified by the following signature.

2.1.1.2 QC Summary Data

Example 8260 Calculations

1.0 Calculating the Response Factor (RF) from the initial calibration (ICAL) data:

RF = [(Ax) (Cis)] / [(Ais) (Cx)]

where:	Example
Ax = Area of the characteristic ion for the compound being measured:	3399156
Cis = Concentration of the specific internal standard (ug/mL)	25
Ais = Area of the characteristic ion of the specific internal standard	846471
Cx = Concentration of the compound in the standard being measured (ug/mL)	100
RF = Calculated Response Factor	**1.0039**

2.0 Calculating the concentration (C) of a compound in water using the average RF: *

Cx = [(Ax) (Cis) (Vn)(D)] / [(Ais) (RF) (Vs)]

where:	**Example**
Ax = Area of the characteristic ion for the compound being measured	**3122498**
Cis = Concentration of the specific internal standard (ug/L)	**25**
D = Dilution factor for sample as a multiplier (10x = 10)	**1**
Ais = Area of the characteristic ion of the specific internal standard	**611048**
RF = Average RF from the ICAL	**1.004**
Vs = Purge volume of sample (mL)	**10**
Vn = Nominal purge volume of sample (mL) (10.0 mL)	**10**
Cx = Concentration of the compound in the sample being measured (ug/L)	**127.2428**

3.0 Calculating the concentration (C) of a compound in soil using the average RF: *

Cx = [(Ax) (Cis) (Wn)(D)] / [(Ais) (RF) (Ws)]

where:	**Example**
Ax = Area of the characteristic ion for the compound being measured	**3122498**
Cis = Concentration of the specific internal standard (ug/L)	**25**
D = Dilution factor for sample as a multiplier (10x = 10)	**1**
Ais = Area of the characteristic ion of the specific internal standard	**611048**
RF = Average RF from the ICAL	**1.004**
Ws = Weight of sample purged (g)	**5**
Wn = Nominal purge weight (g) (5.0 g)	**5**
Cx = Concentration of the compound in the sample being measured (ug/L)	**127.2428**

Dry weight correction:

Percent solids (PCT_S)	**50**
Cd = (Cx) (100)/PCT_S	**254.4856**

* Concentrations appearing on the instrument quantitation reports are on-column results and do not take into account initial volume, final volume, and the dilution factor.

4.0 Concentration from Linear Regression

Step 1: Retrieve Curve Data From Plot, y = mx + b

y = response ratio = response of analyte / response of IS = Ax/Ais

x = amount ratio = concentration analyte/concentration internal standard = Cx / Cis

m = slope from curve = 0.213

b = intercept from curve = - 0.00642

Step 2: Calculate y from Quantitation Report

y = 86550/593147 = 0.1459

Step 3: Solve for x

x = (y - b)/m = [(0.1459 -(- 0.00642)]/ 0.213 = 0.7152

Step 4: Solve for analyte concentration Cx

Cx = Cis (x) = (25.0)(0.7152) = 17.88

Example Spreadsheet Calculation:

Slope from curve, m:	**0.213**
Intercept from curve, b:	**-0.00642**
Area of analyte, Ax:	**86550**
Area of Internal Standard , Ais:	**593147**
Concentration of IS, Cis	**25.00**
Response Ratio:	**0.145917**
Amount Ratio:	**0.715195**
Concentration:	**17.87988**
Units of Internal Standard:	**ug/L**

5.0 Concentration from Quadratic Regression

Step 1 - Retrieve Curve Data from Plot, y = Ax^2 + Bx + C
Where:
Ax^2 + Bx + (C - y) = 0
A, B, C = constants from the ICAL quadratic regression
y = Response ratio = Area of analyte/Area of internal standard (IS)
x = Amount ratio = Concentration of analyte/concentration of IS

Step 2: Calculate y from Quantitation Report

y = Ax/Ais

Step 3: Solve for x using the quadratic formula
Ax^2 + Bx + C - y = 0

$$x = \frac{b \pm \sqrt{\left(b^2 - 4a(c - y)\right)}}{2a}$$ (Two possible solutions)

Step 4: Solve for analyte concentration Cx

Cx = (Cis)(Amount ratio)

Example Spreadsheet Calculation:

Value of A from plot:	**-0.00629**	
Value of B from plot:	**0.511**	
Value of C from plot:	**-0.0276**	
Area of unknown from quantitation report:	**293821**	
Area of IS from quantiation report:	**784848**	
Response ratio, y:	**0.374367**	
C - y:	**-0.40197**	
Root 1 - Computed amount ratio , X1:	**80.44567**	
Root 2 - Computed amount ratio , X2:	**0.794396**	use this solution
Concentration of IS, Cis:	**25.00**	
Concentration of analyte, Cx:	**19.86**	ug/L
