TABLE B.4  
PROJUL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProUCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJULS 1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProUCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJCL S.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA PROJCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProUCL Group           | ProUCL Result (ug/L) | ProUCL Flag | Location   | Sample ID                            | Sample Date | Analysis Date | Analytical Method   | T or D | COPC Group | COPC    | CASRN   | Qualifier | Detection Limit (ug/L) |

TABLE B.4  
PROJCL S.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProUCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProUCL Group           | ProUCL Result (ug/L) | ProUCL Flag | Location | Sample ID                       | Sample Date | Analysis Date | Analytical Method   | T or D | COPC Group | COPC    | CASRN   | Qualifier | Detection Limit (ug/L) |

TABLE B.4  
PROJUL.S.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA PROJUL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProCUL Group           | ProCUL Result (ng/L) | ProCUL Flag | Location | Sample ID                         | Sample Date | Analysis Date | Analytical Method | T or D | COPC Group | COPC    | CASRN   | Qualifier | Detection Limit (ng/L) |

TABLE B.4  
PROJCL S.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProUCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProUCL Group            | ProUCL Result (ug/L) | ProUCL Flag | Location   | Sample ID                             | Sample Date | Analysis Date | Analytical Method   | T or D | COPC Group | COPC    | CASRN   | Qualifier | Detection Limit (ug/L) |

TABLE B.4  
PROCL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProUCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProUCL Group           | ProUCL Result (ug/L) | ProUCL Flag | Location | Sample ID                         | Sample Date | Analysis Date | Analytical Method    | T or D | COPC Group | COPC    | CASRN   | Qualifier | Detection Limit (ug/L) |

TABLE B.4  
PROJUL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProUCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProUCL Group                        | ProUCL Result (µg/L) | ProUCL Flag | Location  | Sample ID                           | Sample Date | Analysis Date | Analytical Method    | T or D | COPC Group | COPC                 | CASRN   | Qualifier | Detection Limit (µg/L) |

TABLE B.4  
PROJUL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA PROJUL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJUL S.1 RAW INPUT FOR GROUNDWATER  
HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProJUL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProJUL Group                          | ProJUL Result (ug/L) | ProJUL Flag | Location | Sample ID                         | Sample Date | Analysis Date | Analytical Method    | T or D | COPC Group | COPC                 | CASRN   | Qualifier | Detection Limit (ug/L) |

TABLE B.4  
PROJUL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProJUL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJUL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA PROJUL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJCL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProJCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJUL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

Notes:  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProUCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProUCL Group              | ProUCL Result (µg/L) | ProUCL Flag | Location | Sample ID                       | Sample Date | Analysis Date | Analytical Method    | T or D | COPC Group | COPC       | CASRN   | Qualifier | Detection Limit (µg/L) |

TABLE B.4  
PROJUL.S.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProUCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProUCL Group              | ProUCL Result (ug/L) | ProUCL Flag | Location | Sample ID                         | Sample Date | Analysis Date | Analytical Method   | T or D | COPC Group | COPC       | CASRN   | Qualifier | Detection Limit (ug/L) |

TABLE B.4  
PROJUL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProUCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProUCL Group               | ProUCL Result (ug/L) | ProUCL Flag | Location   | Sample ID                                | Sample Date | Analysis Date | Analytical Method    | T or D | COPC Group | COPC       | CASRN   | Qualifier | Detection Limit (ug/L) |

TABLE B.4  
PROJUL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProUCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProUCL Group               | ProUCL Result (ug/L) | ProUCL Flag | Location | Sample ID                         | Sample Date | Analysis Date | Analytical Method    | T or D | COPC Group | COPC       | CASRN   | Qualifier | Detection Limit (ug/L) |

TABLE B.4  
PROJECT 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProUCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJECT 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProUCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJECT 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProUCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJUL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProUCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProUCL Group                           | ProUCL Result (ug/L) | ProUCL Flag | Location   | Sample ID                             | Sample Date | Analysis Date | Analytical Method    | T or D | COPC Group | COPC                   | CASRN    | Qualifier | Detection Limit (ug/L) |

TABLE B.4  
PROJUL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN-HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA PROJUL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJCL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProJCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJECT 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProUCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProUCL Group                   | ProUCL Result (µg/L) | ProUCL Flag | Location | Sample ID                       | Sample Date | Analysis Date | Analytical Method   | T or D | COPC Group | COPC                             | CASRN   | Qualifier | Detection Limit (µg/L) |

TABLE B.4  
PROJECT 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProUCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProUCL Group                   | ProUCL Result (µg/L) | ProUCL Flag | Location | Sample ID                      | Sample Date | Analysis Date | Analytical Method   | T or D | COPC Group | COPC                             | CASRN   | Qualifier | Detection Limit (µg/L) |

TABLE B.4  
PROJUL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA PROJUL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJUL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA PROJUL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJCL B.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA PROJCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJCL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA PROJCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJCL S.1 RAW INPUT FOR GROUNDWATER  
HUMAN-HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA PROJCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProUCL Group                                 | ProUCL Result (µg/L) | ProUCL Flag | Location | Sample ID                      | Sample Date | Analysis Date | Analytical Method    | T or D | COPC Group | COPC                    | CASRN     | Qualifier | Detection Limit (µg/L) |

TABLE B.4  
PROJUL S.1 RAW INPUT FOR GROUNDWATER  
HUMAN-HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA PROJUL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJUL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA PROJUL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJECT S.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProUCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJCL S.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProUCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProUCL Group                        | ProUCL Result (ug/L) | ProUCL Flag | Location | Sample ID                         | Sample Date | Analysis Date | Analytical Method    | T or D | COPC Group | COPC               | CASRN   | Qualifier | Detection Limit (ug/L) |
|-------------------------------------|----------------------|-------------|----------|-----------------------------------|-------------|---------------|----------------------|--------|------------|--------------------|---------|-----------|------------------------|

TABLE B.4  
PROJCL 5.1 RAW INPUT FOR GROUNDWATER  
MAXIMUM HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA PROJCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProUCL Group                         | ProUCL Result (ug/L) | ProUCL Flag | Location | Sample ID                      | Sample Date | Analysis Date | Analytical Method    | T or D | COPC Group | COPC               | CASRN   | Qualifier | Detection Limit (ug/L) |

TABLE B.4  
PROJULS.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA PROJUL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJUL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA PROJUL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProUCL Group                       | ProUCL Result (ug/L) | ProUCL Flag | Location    | Sample ID                               | Sample Date | Analysis Date | Analytical Method    | T or D | COPC Group | COPC               | CASRN   | Qualifier | Detection Limit (ug/L) |

TABLE B.4  
PROJUL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN-HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA PROJUL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProUCL Group                        | ProUCL Result (ug/L) | ProUCL Flag | Location   | Sample ID                         | Sample Date | Analysis Date | Analytical Method  | T or D | COPC Group | COPC                    | CASRN    | Qualifier | Detection Limit (ug/L) |

TABLE B.4  
PROJCL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA PROJCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProUCL Group                      | ProUCL Result (ug/L) | ProUCL Flag | Location   | Sample ID                           | Sample Date | Analysis Date | Analytical Method   | T or D | COPC Group | COPC                    | CASRN    | Qualifier | Detection Limit (ug/L) |

TABLE B.4  
PROJULS.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProUCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProUCL Group                      | ProUCL Result (ug/L) | ProUCL Flag | Location | Sample ID                      | Sample Date | Analysis Date | Analytical Method   | T or D | COPC Group | COPC                    | CASRN    | Qualifier | Detection Limit (ug/L) |
|-----------------------------------|----------------------|-------------|----------|--------------------------------|-------------|---------------|---------------------|--------|------------|-------------------------|----------|-----------|------------------------|

TABLE B.4  
PROJUL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProJUL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJUL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN-HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProJUL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJCL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA PROJCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProUCL Group                      | ProUCL Result (ug/L) | ProUCL Flag | Location | Sample ID                         | Sample Date | Analysis Date | Analytical Method | T or D | COPC Group | COPC                    | CASRN    | Qualifier | Detection Limit (ug/L) |

TABLE B.4  
PROJUL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN-TOXIC AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA PROJUL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJUL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProJUL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJCL S.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProUCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProUCL Group             | ProUCL Result (µg/L) | ProUCL Flag | Location | Sample ID                         | Sample Date | Analysis Date | Analytical Method    | T or D | COPC Group | COPC    | CASRN    | Qualifier | Detection Limit (µg/L) |

TABLE B.4  
PROJUL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN-HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA PROJUL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJULIS RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProUCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJCL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProJCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJUL S.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA PROJUL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJCL.S.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA PROJCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProUCL Group                    | ProUCL Result (ug/L) | ProUCL Flag | Location | Sample ID                        | Sample Date | Analysis Date | Analytical Method   | T or D | COPC Group | COPC                  | CASRN   | Qualifier | Detection Limit (ug/L) |

TABLE B.4  
PROJUL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA PROJUL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJCL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProjCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProUCL Group                    | ProUCL Result (ug/L) | ProUCL Flag | Location | Sample ID                          | Sample Date | Analysis Date | Analytical Method | T or D | COPC Group | COPC                  | CASRN   | Qualifier | Detection Limit (ug/L) |

TABLE B.4  
PROJULS.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA PROJUL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJUL S.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA PROJUL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProUCL Group                    | ProUCL Result (µg/L) | ProUCL Flag | Location | Sample ID                      | Sample Date | Analysis Date | Analytical Method    | T or D | COPC Group | COPC           | CASRN   | Qualifier | Detection Limit (µg/L) |

TABLE B.4  
PROJULS.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

Notes:  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProJULS software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJUL S.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProJUL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJCL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN-HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA PROJCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProUCL Group                    | ProUCL Result (ug/L) | ProUCL Flag | Location | Sample ID                         | Sample Date | Analysis Date | Analytical Method    | T or D | COPC Group | COPC           | CASRN   | Qualifier | Detection Limit (ug/L) |

TABLE B.4  
PROJECT 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProUCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProUCL Group                          | ProUCL Result (ug/L) | ProUCL Flag | Location | Sample ID                         | Sample Date | Analysis Date | Analytical Method   | T or D | COPC Group | COPC                      | CASRN   | Qualifier | Detection Limit (ug/L) |

TABLE B.4  
PROJECT 1.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProUCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProUCL Group                      | ProUCL Result (ug/L) | ProUCL Flag | Location | Sample ID                       | Sample Date | Analysis Date | Analytical Method    | T or D | COPC Group | COPC                 | CASRN   | Qualifier | Detection Limit (ug/L) |

TABLE B.4  
PROJCL S.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProUCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJUL 5.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProUCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJULIS RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA PROJULIS software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJCL S.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

Notes:  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA PROJCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProUCL Group                   | ProUCL Result (µg/L) | ProUCL Flag | Location | Sample ID                       | Sample Date | Analysis Date | Analytical Method | T or D | COPC Group | COPC                             | CASRN    | Qualifier | Detection Limit (µg/L) |

TABLE B.4  
PROJCL S.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProJCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProJCL Group                   | ProJCL Result (ug/L) | ProJCL Flag | Location | Sample ID                       | Sample Date | Analysis Date | Analytical Method   | T or D | COPC Group | COPC                      | CASRN    | Qualifier | Detection Limit (ug/L) |

TABLE B.4  
PROJECT S.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProUCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

TABLE B.4  
PROJCL S.1 RAW INPUT FOR GROUNDWATER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA PROJCL software for the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

| ProUCL Group                | ProUCL Result (ug/L) | ProUCL Flag | Location | Sample ID                        | Sample Date | Analysis Date | Analytical Method    | T or D | COPC Group | COPC           | CASRN   | Qualifier | Detection Limit (ug/L) |

Vapor Intrusion Screening  
Level Assessment

---

# Memorandum

**To:** Laura Roebuck, USACE-Mobile  
Joan Hutton, CALIBRE Systems, Inc.

**From:** Clayton Mokri, Vapor Intrusion Task Manager  
Tom Holmes, Project Manager

**Date:** 18 October 2017

**Re:** **Vapor Intrusion Screening Level Assessment**  
**Main Installation, Defense Distribution Depot, Memphis**

---

HDR Environmental, Operations and Construction, Inc. (HDR) has prepared this memorandum to present the screening level assessment of potential vapor intrusion (VI) risk from volatile organic compounds (VOCs) in groundwater beneath the Main Installation (MI) at the former Defense Depot Memphis, Tennessee (DDMT). The assessment utilized the United States Environmental Protection Agency (USEPA) Vapor Intrusion Screening Level Calculator (VISL) and the Johnson and Ettinger (J&E) VI model. This work was performed for the Office of the Assistant Chief of Staff for Installation Management, Base Realignment and Closure Division (ODB) under Contract W91278-16-D-0061, Task Order 0002 with the U.S. Army Corps of Engineers, Mobile District.

## INTRODUCTION

DDMT is located in southeastern Memphis, Tennessee and consists of approximately 632 acres at the MI and Dunn Field. The MI contains approximately 567 acres with open storage areas, warehouses, former military family housing, and outdoor recreational areas. Dunn Field, which is located across Dunn Avenue from the northwest section of the MI, contains approximately 65 acres with former mineral storage and waste disposal areas. Approximately two-thirds of Dunn Field is grassed, and the remaining area is covered with crushed rock and paved surfaces.

From 1942 until closure in 1997, DDMT received, warehoused, and distributed supplies to U.S. military services and civilian agencies. The supplies included hazardous substances; textile products; food products; electronic equipment; construction materials; and industrial, medical, and general supplies. Types of past activities that could have resulted in the presence of hazardous materials in environmental media at the MI include hazardous substance repackaging for storage or shipment, pesticide application, painting and sandblasting, vehicle maintenance and hazardous material handling/storage. These activities resulted in the presence of metals, pesticides, and other less frequently detected chemicals in surface soil, surface water and sediment, and chlorinated volatile organic compounds (CVOCs) in groundwater.

DDMT was placed on the USEPA National Priorities List of contaminated sites in 1992. Numerous remedial investigations and remedial actions have been performed at DDMT resulting in a significant dataset for site lithology and extent of contamination, which is suitable for use in this assessment.

Environmental restoration at the MI includes remedial action and monitoring for specific CVOCs, which are listed as 'primary CVOCs' in site documents, such as *Annual Long-Term Monitoring Report – 2016, Revision 0* (2016 LTM Report) (HDR, 2017). The primary CVOCs consist of tetrachloroethene (PCE), trichloroethene (TCE), cis-1,2-dichloroethene, vinyl chloride (VC), carbon tetrachloride (CT) and chloroform (HDR, 2017). All six CVOCs are listed as being sufficiently volatile and toxic to be considered for potential VI risk in Appendix A of the *DoD Vapor Intrusion Handbook* (DoD, 2009), which is taken from USEPA guidance (USEPA530-D-02-004, 2002). The CVOCs are present in groundwater at concentrations up to 300 micrograms per liter (µg/L). The groundwater plumes, and potentially soil contamination, are present beneath commercial/industrial buildings at the site presenting a potential VI risk to current and future building occupants.

## METHODS

### Groundwater Data

As an initial step, HDR prepared a comprehensive vapor intrusion map for the MI ([Figure 1](#)) to show the location of the CVOC plumes, CVOC concentrations at individual wells, groundwater elevation contours, and the locations of existing buildings with the building number and current tenant/owner name. The groundwater elevations and validated analytical results are from the October 2016 sampling event, as presented in *Annual Long-Term Monitoring Report – 2016, Revision 0* (HDR, 2017). The October 2016 analytical results and water level measurements are consistent with historical results.

### Current and Future Land Use

Land use controls have been established for the MI that prevent the construction of residential development or child daycare facilities (CH2MHILL, 2004), except for the eastern parcel depicted on [Figure 1](#), which is available for unrestricted use. Current building tenants or unoccupied buildings, where noted, were identified as documented on the February 2, 2016 site plan, *Memphis Depot Industrial Park, Tenant Locations*. The buildings are used for warehousing and light industrial use. This assessment evaluated the VI risk with commercial exposure assumptions.

### Constituents of Potential Concern and Initial Exposure Assessment

The primary CVOCs detected in monitoring wells on the MI were evaluated to develop the list of constituents of potential concern (COPCs) in [Table 1](#). One of the primary CVOCs for the MI (cis-1,2-dichloroethene) is not included as a COPC because the toxicity data (reference concentration and inhalation unit risk) used to calculate VI screening levels are not established (USEPA, 2017).

To evaluate whether a VI exposure pathway is complete, the COPCs listed above were selected in the VISL calculator to identify a groundwater screening level (SL) protective of the VI risk. VISL (USEPA, 2016) calculated the SL based on commercial land use, groundwater to indoor air attenuation factor of 0.001, 25 degree Celsius average groundwater temperature, Henry's law constant, and the indoor air regional screening level (RSL) with a target cancer risk of  $1 \times 10^{-6}$  and non-cancer hazard index of 1.0 (USEPA, 2017). The calculated SLs are listed in [Table 1](#) and the VISL spreadsheet is included as [Appendix A-1](#).

**Table 1. Groundwater COPCs and Screening Levels**

| COPC                      | Screening Level (µg/L) |
|---------------------------|------------------------|
| Carbon Tetrachloride (CT) | 1.8                    |
| Chloroform                | 3.6                    |
| Tetrachloroethene (PCE)   | 65                     |
| Trichloroethene (TCE)     | 7.4                    |
| Vinyl Chloride (VC)       | 2.5                    |

The October 2016 groundwater analytical results and the SLs were used to identify where groundwater concentrations of COPCs exceed the SLs. Generally, at properties where subsurface concentrations of vapor-forming chemicals (e.g. groundwater or "near source" soil gas concentrations) fall below SLs, no further action or study is warranted (USEPA, 2014). As illustrated on [Figure 1](#), contaminants are present in groundwater greater than SLs and in many cases, are present beneath occupied commercial buildings; therefore, the VI pathway is complete (USEPA, 2015).

## RISK CHARACTERIZATION

Where a complete VI exposure has been identified, preexisting and readily ascertainable data may be compared to recommended generic VI screening criteria to develop insights about the potential level of exposure and risk posed by VI (USEPA, 2015). To further evaluate the VI risk, HDR reviewed October 2016 groundwater analytical results. Wells DR2-1, MW-100B and PMW21-04 were selected as they had the highest concentrations of the most common COPCs (PCE, TCE and VC) among the wells sampled and are located adjacent to occupied buildings.

The VI risk was estimated using the May 2016 VISL Calculator (USEPA, 2016) commercial exposure endpoints, default 25 degree Celsius (C) groundwater temperature, and the COPC concentrations detected in groundwater at the selected wells during the October 2016 sampling (Table 2). To further evaluate the VI risk, the J&E model (USEPA, 2003) incorporated additional site specific information such as depth to water, approximate 22°C groundwater temperature (HDR, 2017), and soil type(s). The VISL and/or J&E model input data used to estimate the potential for VI risk at the MI is presented on Table 2.

**Table 2. Input Parameters**

|                                                | Well DR2-1                   | Well MW-100B                    | Well PMW21-04                  |
|------------------------------------------------|------------------------------|---------------------------------|--------------------------------|
| Depth to Water (feet/centimeters)              | 84.97/2,590                  | 82.87/2,526                     | 83.49/2,545                    |
| Soil Type (depth in feet below ground surface) | Clay (0-30),<br>Sand (26-85) | Clay (0-18.5)<br>Sand (18.5-83) | Clay (0-26),<br>Sand (26-83.5) |
| Chloroform (µg/L)                              | 4.97                         | 0.3 U                           | 0.157                          |
| CT (µg/L)                                      | 32                           | 1.0 U                           | 1.0 U                          |
| PCE (µg/L)                                     | 208                          | 1.09                            | 293                            |
| TCE (µg/L)                                     | 5.92                         | 0.306                           | 122                            |
| VC (µg/L)                                      | 1.0 U                        | 101                             | 1.0 U                          |

The cancer and non-cancer risk from VI of COPCs in groundwater to indoor air were calculated using commercial exposure assumptions, the USEPA's June 2017 unit risk factors and reference concentrations to generate cancer and non-cancer risk estimates (USEPA, 2017). The VISL spreadsheets for each of the selected wells are provided in Appendix A ([A-2](#) to [A-4](#))

and the J&E model results are provided in Appendix B (B-1 to B-3). The calculated risk estimates are presented for wells DR2-1, MW-100B and PMW21-04 in Tables 3, 4, and 5, respectively.

**Table 3. Well DR2-1 VI Risk Results**

| COPC       | Cancer Risk                            |                                        | Non-Cancer Risk |        |
|------------|----------------------------------------|----------------------------------------|-----------------|--------|

The VISL calculator identified a cumulative cancer risk greater than  $1 \times 10^{-6}$  for one or more individual COPCs and the combined risk at all three wells; a non-cancer risk greater than 1.0 was identified for two individual COPCs at PMW21-04 and for the combined risk at PMW21-04 and DR2-1. The J&E model identified a cumulative cancer risk greater than  $1 \times 10^{-6}$  for one individual COPC and the combined risk at all three wells; a non-cancer risk greater than 1.0 was not identified at these wells.

The cancer and non-cancer risks calculated by VISL are five to ten times greater than the risks calculated with the J&E model. This difference is largely due to the incorporation of site-specific lithological data and depth to contamination in the J&E model to estimate an indoor air concentration rather than the VISL default attenuation factor of 0.001.

While the VISL and J&E models calculated different cancer and non-cancer risks, both methods identified risks greater than the target  $1 \times 10^{-6}$  for cancer (USEPA, 2015); therefore, VOCs are present in the subsurface that may present an unacceptable human health risk from VI. In addition to the VI risk identified at wells PMW21-04, DR2-1 and MW100B, COPCs detected in other wells on the MI may also present a VI risk (Figure 1).

## CONCLUSIONS AND RECOMMENDATIONS

This assessment concludes:

- Chemicals present in groundwater are sufficiently volatile and toxic to pose a potential human health risk from VI to indoor air of current and future buildings;
- Recent analytical results for COPCs in groundwater exceed commercial SLs estimated using the VISL calculator beneath occupied buildings indicating a potential human health risk from VI (Figure 1); and
- October 2016 groundwater analytical results and lithological data for three representative wells (PMW21-04, DR2-1, and MW100B) used with the J&E model provided lower human health risk estimates than with the VISL calculator; the J&E results were an order of magnitude lower for cancer risk and about 50 percent lower for non-cancer risk.

The potential human health risk from COPCs in groundwater within occupied structures at DDMT is greater than  $1 \times 10^{-6}$  for cancer and greater than 1.0 for non-cancer. Soil gas samples will be collected in order to more precisely estimate human health risk. A work plan for soil gas sampling will be prepared in accordance with the statement of Work for Task Order 0002.

EPA-OLEM VAPOR INTRUSION ASSESSMENT

Vapor Intrusion Screening Level (VSL) Calculator Version 3.5.1 (May 2016 RSLs)

The primary objective of risk-based screening is to identify sites or buildings unlikely to pose a health concern through the vapor intrusion pathway. Generally, at properties where subsurface concentrations of vapor-forming chemicals (e.g., groundwater or "near source" soil gas concentrations) fall below screening levels (i.e., VSLs), no further action or study is warranted, so long as the exposure assumptions match those taken into account by the calculations and the site fulfills the conditions and assumptions of the generic conceptual model underlying the screening levels. In a similar fashion, the results of risk-based screening can help the data review team identify onsite, buildings, and/or chemicals that can be eliminated from further assessment. The generic conceptual model underlying these screening levels is described in OSWER Publication 9200.2-154 (OSWER Technical Guide for Assessing and Mitigating the Vapor Intrusion Pathway From Subsurface Vapor Sources to Indoor Air) (EPA 2015, Section 6.5)

Mutagenic Chemicals

The exposure durations and age-dependent adjustment factors for mutagenic-mode-of-action are listed in the table below:

| Age Cohort    | Exposure Duration (years) | Age-dependent adjustment factor |
|---------------|---------------------------|---------------------------------|
| 0 - 2 years   | 2                         | 10                              |
| 2 - 6 years   | 4                         | 3                               |
| 6 - 16 years  | 10                        | 3                               |
| 16 - 26 years | 10                        | 1                               |

Mutagenic-mode-of-action (MMAOA) adjustment factor 25

This factor is used in the equations for mutagenic chemicals.

See the Navigation Guide equation for CiAc for vinyl chloride.

Notation:

NVT = Not sufficiently volatile and/or toxic to pose inhalation risk in selected exposure scenario for the indicated medium

C = Carcinogenic

NC = Non-carcinogenic

I = RfC: EPA Integrated Risk Information System (IRIS). Available online at:

P = PPRTV: EPA Provisional Peer Reviewed Toxicity Values (PPRTVs). Available online at:

A = Agency for Toxic Substances and Disease Registry (ATSDR) Minimum Risk Levels (MRLs). Available online at:

CA = California Environmental Protection Agency/Office of Environmental Health Hazard Assessment assessments. Available online at:

H = HEAST: EPA Superfund Health Effects Assessment Summary Tables (HEAST) database. Available online at:

S = See RSL User Guide, Section 5

X = PPRTV Appendix

E = The Engineering Toolbox. Available online at [http://www.engineeringtoolbox.com/explosive-concentration-limits-d\\_423.html](http://www.engineeringtoolbox.com/explosive-concentration-limits-d_423.html)

N = Centers for Disease Control and Prevention (CDC) National Institute for Occupational Safety and Health (NIOSH). Pocket Guide to Chemical Hazards. Available online at:

M = Chemical-specific MSDS

Mut = Chemical acts according to the mutagenic-mode-of-action, special exposure parameters apply (see footnote (d) above).

VC = Special exposure equation for vinyl chloride applies (see Navigation Guide for equation).

TCE = Special mutagenic and non-mutagenic IURs for trichloroethylene apply (see footnote (d) above).

Yellow highlighting indicates site-specific parameters that may be edited by the user.

Blue highlighting indicates exposure factors that are based on Risk Assessment Guidance for Superfund (RAGS) or EPA vapor intrusion guidance, which generally should not be changed.

\*\*Lower explosive limit is the minimum concentration of the compound in air (% by volume) that is needed for the gas to ignite and explode.

Mutagenic Chemicals

The exposure durations and age-dependent adjustment factors for mutagenic-mode-of-action are listed in the table below:

Note: This section applies to trichloroethylene and other mutagenic chemicals, but not to vinyl chloride.

| Age Cohort    | Exposure Duration | Age-dependent adjustment factor |
|---------------|-------------------|---------------------------------|
| 0 - 2 years   | 2                 | 10                              |
| 2 - 6 years   | 4                 | 3                               |
| 6 - 16 years  | 10                | 3                               |
| 16 - 26 years | 10                | 1                               |

Mutagenic-mode-of-action (MMA) adjustment factor

25

This factor is used in the equations for mutagenic chemicals.

Vinyl Chloride

See the Navigation Guide equation for Cia,c for vinyl chloride.

Used to calculate risk-based  
groundwater concentration.

# DATA ENTRY SHEET

## RISK-BASED GROUNDWATER CONCENTRATION CALCULATIONS:

| Indoor exposure groundwater conc., carcinogen (µg/L) | Indoor exposure groundwater conc., noncarcinogen (µg/L) | Risk-based indoor exposure groundwater conc., (µg/L) | Pure component water solubility, S (µg/L) | Final indoor exposure groundwater conc., (µg/L) |
|------------------------------------------------------|---------------------------------------------------------|------------------------------------------------------|-------------------------------------------|-------------------------------------------------|
| NA                                                   | NA                                                      | NA                                                   | 1.10E+06                                  | NA                                              |

## INCREMENTAL RISK CALCULATIONS:

| Incremental risk from vapor intrusion to indoor air, carcinogen (unitless) | Hazard quotient from vapor intrusion to indoor air, noncarcinogen (unitless) |
|----------------------------------------------------------------------------|------------------------------------------------------------------------------|
| 5.6E-08                                                                    | 3.9E-02                                                                      |

MESSAGE AND ERROR SUMMARY BELOW: (DO NOT USE RESULTS IF ERRORS ARE PRESENT)

MESSAGE: Risk/HQ or risk-based groundwater concentration is based on a route-to-route extrapolation.

Used to calculate risk-based  
groundwater concentration.

# DATA ENTRY SHEET

## RISK-BASED GROUNDWATER CONCENTRATION CALCULATIONS:

| Indoor exposure groundwater conc., carcinogen (µg/L) | Indoor exposure groundwater conc., noncarcinogen (µg/L) | Risk-based indoor exposure groundwater conc., (µg/L) | Pure component water solubility, S (µg/L) | Final indoor exposure groundwater conc., (µg/L) |
|------------------------------------------------------|---------------------------------------------------------|------------------------------------------------------|-------------------------------------------|-------------------------------------------------|
| NA                                                   | NA                                                      | NA                                                   | 1.10E+06                                  | NA                                              |

## INCREMENTAL RISK CALCULATIONS:

| Incremental risk from vapor intrusion to indoor air, carcinogen (unitless) | Hazard quotient from vapor intrusion to indoor air, noncarcinogen (unitless) |
|----------------------------------------------------------------------------|------------------------------------------------------------------------------|
| 3.0E-09                                                                    | 2.1E-03                                                                      |

MESSAGE AND ERROR SUMMARY BELOW: (DO NOT USE RESULTS IF ERRORS ARE PRESENT)

MESSAGE: Risk/HQ or risk-based groundwater concentration is based on a route-to-route extrapolation.

A decorative graphic on the left side of the page consists of several overlapping rectangles. A large red rectangle is positioned in the middle-left. Above it, a dark gray rectangle extends from the top edge. Below the red rectangle, a light gray rectangle extends from the bottom edge. To the right of the red rectangle, a black rectangle is positioned at the bottom. The text 'D' is located to the right of the red rectangle.

#### Notes:

These EPCs for groundwater will be used in the resident, worker and construction worker scenarios. Only unfiltered (total) groundwater data are evaluated.  
The exposure point concentration (EPC) is the 95% upper confidence limit (UCL) of the arithmetic mean. When the UCL is greater than the maximum detected concentration or ProUCL did not calculate an UCL, the maximum detected concentration is chosen.  
The most appropriate UCL is chosen from those ProUCL suggests based on the distribution of the dataset and ProUCL guidance.

#### Abbreviations:

COPC -- Constituent of potential concern  
EPC -- Exposure point concentration  
Qual -- Qualifier  
NA -- Not analyzed or applicable  
ND -- Not detected  
UCL -- 95% Upper confidence limit

**Notes:**

These EPCs for groundwater will be used in the resident, worker and construction worker scenarios. Only unfiltered (total) groundwater data are evaluated.

The exposure point concentration (EPC) is the 95% upper confidence limit (UCL) of the arithmetic mean. When the UCL is greater than the maximum detected concentration or ProUCL did not calculate an UCL, the maximum detected concentration is chosen.

The most appropriate UCL is chosen from those ProUCL suggests based on the distribution of the dataset and ProUCL guidance.

**Abbreviations:**

COPC -- Constituent of potential concern

EPC -- Exposure point concentration

Qual -- Qualifier

NA -- Not analyzed or applicable

ND -- Not detected

UCL -- 95% Upper confidence limit

**Note:**  
(1) The EPC is the lower of the 95% upper confidence limit and maximum detected concentration. See Table 3s.  
The dermal parameters were taken from the chemical parameter table of the USEPA June 2017 RSL tables and RAGS Part E.

**Abbreviations:**  
CF1 -- Conversion Factor 1 (0.001 mg/ug)  
CF2 -- Conversion Factor 2 (0.001 L/cm<sup>3</sup>)  
C<sub>w</sub> -- Groundwater or surface water concentration  
VOC -- Volatile organic compound

|                                                               | FA x K <sub>p</sub> x C <sub>w</sub> x (t <sub>event</sub> / ((1+B) + 2 x t <sub>event</sub> x ((1 + 3B + 3B <sup>2</sup> )/(1+B) <sup>2</sup> ))) x CF1 x CF2 |

**Note:**  
(1) The EPC is the lower of the 95% upper confidence limit and maximum detected concentration. See Table 3s.  
The dermal parameters were taken from the chemical parameter table of the USEPA June 2017 RSL tables and RAGS Part E.

**Abbreviations:**  
CF1 -- Conversion Factor 1 (0.001 mg/ug)  
CF2 -- Conversion Factor 2 (0.001 L/cm<sup>3</sup>)  
C<sub>w</sub> -- Groundwater or surface water concentration  
VOC -- Volatile organic compound

|---------------------------------------------------------------|-------------------|----------------------|
| C <sub>a</sub> = concentration of chemical in air             | mg/m <sup>3</sup> | Solved by Eq 1       |
| C <sub>a-max</sub> = maximum concentration of chemical in air | mg/m <sup>3</sup> | Solved by Eq 2       |
| t <sub>1</sub> = Adult time in shower                         | hr                | 0.25                 |
| t <sub>1</sub> = Child time in shower                         | hr                | 0.33                 |
| t <sub>2</sub> = Adult time in bathroom after shower          | hr                | 0.46                 |
| t <sub>2</sub> = Child time in bathroom after shower          | hr                | 0.21                 |
| f = fraction volatilized for chemical                         | unitless          | 0.9                  |
| F <sub>w</sub> = shower water flow rate                       | L/hr              | 1000                 |
| V <sub>a</sub> = bathroom volume                              | m <sup>3</sup>    | 6                    |

|             |                      |                                                                                                                        |
|-------------|----------------------|------------------------------------------------------------------------------------------------------------------------|
| Equation 1: | C <sub>a</sub> =     | ((C <sub>a-max</sub> /2) * t <sub>1</sub> + C <sub>a-max</sub> * t <sub>2</sub> ) / (t <sub>1</sub> + t <sub>2</sub> ) |
| Equation 2: | C <sub>a-max</sub> = | (C <sub>w</sub> * f * F <sub>w</sub> * t <sub>1</sub> ) / V <sub>a</sub>                                               |

**Note:**

(1) The EPC is the lower of the 95% UCL and maximum detected concentration - see Table 3s.

The most conservative value of the ranges for each exposure parameter, as presented in Schaum et al 1994, is applied for the calculations. The shower model air chemical concentrations are calculated for only VOCs.

Total exposure times for are 0.71 hr for an adult and 0.54 hr for a child (0-6 years). Professional judgement is used to split up the time spent in the shower versus in the bathroom after shower. An adult is assumed to spend approximately 15 minutes showering followed by 28 minutes in the bathroom, for a total of 43 minutes (0.71 hr). A child is assumed to spend approximately 20 minutes bathing followed by 13 minutes in the bathroom for a total of 32 minutes (0.54 hr).

**Abbreviation:**

CW -- Groundwater water concentration

EPC -- Exposure point concentration

VOC -- Volatile organic compound

#### Notes:

The exposure point concentration (EPC) is the 95% upper confidence limit (UCL), except when the UCL was greater than the maximum detected concentration or ProUCL did not calculate an UCL.

The constituent of potential concern (COPC) list is based on exceedances from screening of maximum detected concentrations against risk-based criteria in the Table 2s.

The single-chemical cancer risks incorporate the one hit equations for cancer risks > 0.01, per RAGs Part A Chapter 8: Risk = 1 - exp(-Dose x SF).

RAGS Part E does not provide dermal soil absorption fraction values (ABSd) for most VOCs; therefore a dermally absorbed dose is not calculated.

The DAvent values for dermal exposure to groundwater are calculated in Table 4.Supp.3A to D.

#### Abbreviations:

COPC -- Constituent of potential concern

CSF -- Oral cancer slope factor

EPC -- Exposure point concentration

IUR -- Inhalation unit risk

RIC -- Inhalation reference concentration

RfD -- Oral reference dose

**Notes:**

The exposure point concentration (EPC) is the 95% upper confidence limit (UCL), except when the UCL was greater than the maximum detected concentration or ProUCL did not calculate an UCL.

The constituent of potential concern (COPC) list is based on exceedances from screening of maximum detected concentrations against risk-based criteria in the Table 2s.

The single-chemical cancer risks incorporate the one hit equations for cancer risks  $> 0.01$ , per RAGS Part A Chapter 8. Risk =  $1 - \exp(-\text{Dose} \times \text{SF})$ .

RAGS Part E does not provide dermal soil absorption fraction values (ABSd) for most VOCs; therefore a dermally absorbed dose is not calculated.

The DAvent values for dermal exposure to groundwater are calculated in Table 4.Supp.3A to D.

**Abbreviations:**

COPC -- Constituent of potential concern

CSF -- Oral cancer slope factor

EPC -- Exposure point concentration

IUR -- Inhalation unit risk

RfC -- Inhalation reference concentration

RfD -- Oral reference dose

TABLE D.10  
CALCULATION OF COPC CANCER RISKS AND NONCANCER HAZARDS FOR A RESIDENT - CORE OF THE PLUME - INTERMEDIATE AQUIFER  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

Scenario Timeframe: Future  
Receptor Population: Resident  
Receptor Age: Adult and Child (0-6 yrs)

Notes:

The exposure point concentration (EPC) is the 95% upper confidence limit (UCL), except when the UCL was greater than the maximum detected concentration or ProUCL did not calculate an UCL.

The constituent of potential concern (COPC) list is based on exceedances from screening of maximum detected concentrations against risk-based criteria in the Table 2s.

The single-chemical cancer risks incorporate the one hit equations for cancer risks > 0.01, per RAGs Part A Chapter 8: Risk = 1 - exp(-Dose x SF).

RAGS Part E does not provide dermal soil absorption fraction values (ABSd) for most VOCs; therefore a dermally absorbed dose is not calculated.

The age-adjustments for a resident's cancer risk are calculated in Table 4.Supp.1.

The exposure intakes for MMOA chemicals (e.g., chromium) are adjusted for age are calculated in Tables 4.Supp.2.

The DAvent values for dermal exposure to groundwater are calculated in Table 4.Supp.3A to D.

The inhalation pathway uses groundwater-derived shower vapors (Ca) as the EPC, which are calculated using the Andelman model modified by Schaum et al, in Table 4.Supp.4A, B and C.

For a resident's exposure to vinyl chloride in soil for a cancer endpoint, the CA is calculated using only the volatilization pathway (as opposed to also including the particulate pathway) as presented in the USEPA RSL equations.

Abbreviations:

COPC – Constituent of potential concern

CSF – Oral cancer slope factor

EPC – Exposure point concentration

IUR - Inhalation unit risk

RfC – Inhalation reference concentration

RfD – Oral or dermal reference dose

UCL – Upper confidence limit

| Suggested UCL to Use                                                                                                                                                                             |  |        |                                                     |  |       |
| 95% H-UCL                                                                                                                                                                                        |  | 8.724  |                                                     |  |       |
| Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.                                                                     |  |        |                                                     |  |       |
| Recommendations are based upon data size, data distribution, and skewness.                                                                                                                       |  |        |                                                     |  |       |
| These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).                                                                         |  |        |                                                     |  |       |
| However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.                                                        |  |        |                                                     |  |       |
| ProUCL computes and outputs H-statistic based UCLs for historical reasons only.                                                                                                                  |  |        |                                                     |  |       |
| H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.                                                                           |  |        |                                                     |  |       |
| It is therefore recommended to avoid the use of H-statistic based 95% UCLs.                                                                                                                      |  |        |                                                     |  |       |
| Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.                                                                       |  |        |                                                     |  |       |
| result (fluvial_1,2,3-trichloropropane_96-18-4)                                                                                                                                                  |  |        |                                                     |  |       |

| Coefficient of Variation                                                                                                                                                                         |  | 0.833  | Skewness                                            |  | 1.081 |
| Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest. |  |        |                                                     |  |       |
| For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).                                                                                                                     |  |        |                                                     |  |       |
| Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1                                                                                                          |  |        |                                                     |  |       |
| Normal GOF Test                                                                                                                                                                                  |  |        |                                                     |  |       |
| Shapiro Wilk Test Statistic                                                                                                                                                                      |  | 0.789  | Shapiro Wilk GOF Test                               |  |       |

Suggested UCL to Use

|           |       |
|-----------|-------|
| 95% H-UCL | 72.43 |
|-----------|-------|

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.

H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.

It is therefore recommended to avoid the use of H-statistic based 95% UCLs.

Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

| 95% Student's-t UCL                                                                                                                                                                              | 62.02  |                                                                 |        |
| When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test                                                                                                   |        |                                                                 |        |
| When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL                                                                           |        |                                                                 |        |
| Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.                                                                     |        |                                                                 |        |
| Recommendations are based upon data size, data distribution, and skewness.                                                                                                                       |        |                                                                 |        |
| These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).                                                                         |        |                                                                 |        |
| However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.                                                        |        |                                                                 |        |
| result (fluvial_1,2-dichloroethane_107-06-2)                                                                                                                                                     |        |                                                                 |        |

| 95% Student's-t UCL                                                                                                                                                                                           | 12.48 |                                                |       |
| Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.                                                                                  |       |                                                |       |
| Recommendations are based upon data size, data distribution, and skewness.                                                                                                                                    |       |                                                |       |
| These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).                                                                                      |       |                                                |       |
| However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.                                                                     |       |                                                |       |
| Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positively skewed data sets. |       |                                                |       |

| 95% Student's-t UCL                                                                                                                                                                                           | 271.8  |                                                                 |       |
| Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.                                                                                  |        |                                                                 |       |
| Recommendations are based upon data size, data distribution, and skewness.                                                                                                                                    |        |                                                                 |       |
| These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).                                                                                      |        |                                                                 |       |
| However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.                                                                     |        |                                                                 |       |
| Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positively skewed data sets. |        |                                                                 |       |

| Suggested UCL to Use                                                                                                                      |        |                                                     |       |
| 95% H-UCL                                                                                                                                 | 64.98  |                                                     |       |
| Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.              |        |                                                     |       |
| Recommendations are based upon data size, data distribution, and skewness.                                                                |        |                                                     |       |
| These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).                  |        |                                                     |       |
| However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician. |        |                                                     |       |
| ProUCL computes and outputs H-statistic based UCLs for historical reasons only.                                                           |        |                                                     |       |
| H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.                    |        |                                                     |       |
| It is therefore recommended to avoid the use of H-statistic based 95% UCLs.                                                               |        |                                                     |       |
| Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.                |        |                                                     |       |
| result (fluvial_trichloroethylene_79-01-6)                                                                                                |        |                                                     |       |

| 95% Student's-t UCL                                                                                                                       | 192.2  |                                                                 |       |  |  |
| Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.              |        |                                                                 |       |  |  |
| Recommendations are based upon data size, data distribution, and skewness.                                                                |        |                                                                 |       |  |  |
| These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).                  |        |                                                                 |       |  |  |
| However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician. |        |                                                                 |       |  |  |

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.

For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).

Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

| Suggested UCL to Use                                                                                                                                                                                          |       |                                          |       |
| 95% Student's-t UCL                                                                                                                                                                                           | 1.546 |                                          |       |
| Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.                                                                                  |       |                                          |       |
| Recommendations are based upon data size, data distribution, and skewness.                                                                                                                                    |       |                                          |       |
| These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).                                                                                      |       |                                          |       |
| However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.                                                                     |       |                                          |       |
| Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positively skewed data sets. |       |                                          |       |
| result (/uc_1,2,4-trimethylbenzene_95-63-6)                                                                                                                                                                   |       |                                          |       |

| Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.                                                                                  |        |                                                                 |                                             |       |
| Recommendations are based upon data size, data distribution, and skewness.                                                                                                                                    |        |                                                                 |                                             |       |
| These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).                                                                                      |        |                                                                 |                                             |       |
| However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.                                                                     |        |                                                                 |                                             |       |
| Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positively skewed data sets. |        |                                                                 |                                             |       |

TABLE D.12

PROUCL 5.1 RAW OUTPUT FOR GROUNDWATER - CORE OF THE PLUME - INTERMEDIATE AQUIFER

HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT

MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

|                                                                                                                                                                                                               |  |        |  |                                                                 |  |       |  |  |  |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|--------|--|-----------------------------------------------------------------|--|-------|--|--|--|
| Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.                                                                                  |  |        |  |                                                                 |  |       |  |  |  |
| Recommendations are based upon data size, data distribution, and skewness.                                                                                                                                    |  |        |  |                                                                 |  |       |  |  |  |
| These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).                                                                                      |  |        |  |                                                                 |  |       |  |  |  |
| However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.                                                                     |  |        |  |                                                                 |  |       |  |  |  |
| Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positively skewed data sets. |  |        |  |                                                                 |  |       |  |  |  |
| result (i/uc_methylene chloride_75-09-2)                                                                                                                                                                      |  |        |  |                                                                 |  |       |  |  |  |

| 95% Student's-t UCL                                                                                                                                                                                           | 16.84     |                              |       |
| Recommended UCL exceeds the maximum observation                                                                                                                                                               |           |                              |       |
| Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.                                                                                  |           |                              |       |
| Recommendations are based upon data size, data distribution, and skewness.                                                                                                                                    |           |                              |       |
| These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).                                                                                      |           |                              |       |
| However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.                                                                     |           |                              |       |
| Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positively skewed data sets. |           |                              |       |

| Suggested UCL to Use                                                                                                                      |        |                                                |                           |       |       |
| 95% Adjusted Gamma UCL                                                                                                                    | 5.613  |                                                |                           |       |       |
| When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test                                            |        |                                                |                           |       |       |
| When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL                    |        |                                                |                           |       |       |
| Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.              |        |                                                |                           |       |       |
| Recommendations are based upon data size, data distribution, and skewness.                                                                |        |                                                |                           |       |       |
| These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).                  |        |                                                |                           |       |       |
| However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician. |        |                                                |                           |       |       |

TABLE D.13  
PROUCL 5.1 RAW INPUT FOR GROUNDWATER - CORE OF THE PLUME  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
MAIN INSTALLATION - DEFENSE DEPOT MEMPHIS, TENNESSEE

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProUCL software for the "Core of the Plume" evaluation in the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

**Notes:**  
The data set provided here are for constituents of potential concern (COPCs) that were determined in the initial screening to calculate 95% upper confidence limits (UCLs) using USEPA ProUCL software for the "Core of the Plume" evaluation in the risk assessment. This is not a complete data set.  
The maximum of the field duplicate and parent sample results was applied.  
The detection limit is the method detection limit if available; otherwise, it is the reporting limit.

A decorative graphic on the left side of the page consists of several overlapping rectangles. A large red rectangle is positioned in the middle-left. Above it, a dark gray rectangle extends from the top edge. Below the red rectangle, a light gray rectangle extends from the bottom edge. To the right of the red rectangle, a black rectangle is positioned at the bottom. The overall layout is minimalist and modern.

## 34.0 Baseline Risk Assessment for FU7

---

### 34.1 Human Health Evaluation

This RA was conducted in accordance with the RA approach presented in Section 7.0 and the agreements reached during meetings with the agencies, which are presented in Appendix A. This section describes each of the four steps of the RA applied to groundwater at the Main Installation, addressed as FU7. Figure 32-1 shows the locations of the groundwater monitoring wells across the Main Installation and immediately off-site of the Depot. The Allen Well Field location and the potentiometric surface map are shown on Figures 2-14 and 2-12, respectively. Monitoring well data collected between 1996 and 1998 were used for this RI/RA. Figures 32-2 to 32-7 present the distribution of CVOCs in the monitoring wells in the Main Installation.

A network of monitoring wells and pizometers was used to evaluate the nature and extent of groundwater contamination at the Main Installation. Low levels of chlorinated organic VOCs were detected in the southeastern, southwestern, and central portions of the Main Installation. No correlation between subsurface soil and groundwater contamination was found. The organic chemicals detected in the southeastern portion of the Main Installation were found to include chlorinated solvents at higher concentrations near the property boundary in the off-site and upgradient location (groundwater flows to the northwest toward the center of Main Installation), indicating a possible off-site source. Similarly, groundwater in the southwestern portion has the chlorinated solvents TCE and PCE, with the highest concentrations in the off-site upgradient location (PZ04). Groundwater from this area also flows to the center in the northeastern portion of the Main Installation. Dry cleaning facilities, which have since been removed, may have been the sources of the PCE and its degradation products.

Potential risks from groundwater use within the Main Installation are estimated for three separate areas represented by a plume in the southwestern area (Plume A), a plume in the southeastern area (Plume B), and a separate more diffuse area (Plume C) in the center of the Main Installation. Each of these plumes for this RA are defined by the monitoring results from the following wells:

- Plume A is represented by temporary and permanent wells HY02, MW-21, MW-22, MW-23, MW-47, and PZ04;
- Plume B is represented by temporary and permanent wells HY03, HY04, MW-25, MW-26, MW-64, and PZ05; and
- Plume C is represented by temporary and permanent wells MW-34, MW-43, MW-38, MW-39, MW-62, MW-63, and PZ03.

As discussed in Section 32.0, inorganic chemicals tend to be commonly and sporadically distributed throughout the Main Installation groundwater (see Table 32-3). Their occurrence also was sporadic during various monitoring periods. For example, arsenic was detected in only one well in the fourth quarter 1998 monitoring (see Figure 32-17). Metals concentrations appear to be slightly elevated in the southwestern corner (two wells, MW-21 and MW-22) near the plating shop. Concentrations were significantly lower during the fourth quarter 1998 monitoring. Groundwater from this area (southwest) moves to the center of the site toward two troughs, one located in the south-central portion of the Main Installation and a second located in the northwestern portion (see Figure 2-12). All of the data from 1996 to 1998 were included in this COPCs selection and the risk estimations.

There currently is no groundwater use within or surrounding the Depot. In the interest of conservatism, a future exposure scenario was assumed whereby industrial and residential receptors are exposed to groundwater via potable use. This section therefore focuses on risk estimations for a hypothetical future groundwater use.

### **34.1.1 COPC Selection**

Chemicals detected in the monitoring wells above background levels and groundwater screening levels were selected as COPCs, as discussed in Section 7.0. Groundwater screening levels are determined by the most conservative of three values: MCLs, MCLGs, and EPA Region III Tap Water RBC values (see Appendix D). To maintain conservatism in this risk analysis, target analytes are sometimes retained as COPCs even though they may be detected below MCLs. Detected compounds analyzed to characterize general aquifer water quality (sodium, chloride, total dissolved solids [TDS], and nitrate/nitrite) or essential nutrients are not important for human health protection and often do not have a toxicity value. Therefore, these general chemistry parameters were not included as COPCs. The COPCs used for the RA for FU7 are shown in Table 34-1.

### **34.1.2 Exposure Assessment**

A CSM for groundwater was discussed briefly in Section 33.2. The primary sources of COPCs in the environmental media within the Main Installation are historical spills and leaks from the storage of chemicals and the surface application of pesticides, herbicides, and waste oil, as well as any unknown buried wastes disposed during Depot operations. Contaminants could be transported through infiltration and leaching to shallow groundwater and subsequently could migrate to downgradient areas.

Section 33.0 presents a fate and transport discussion for the groundwater flow direction, velocity, and contaminant migration pathways. The site groundwater fate and transport can be summarized as follows. Groundwater in the uppermost water-bearing unit, the fluvial aquifer, flows from south, east, and west to lows in the potentiometric surface toward the center of the Main Installation. One low is toward the northwestern portion of the Main Installation and a second is present in the south-central portion. On the basis of

the available data, site groundwater is moving at a rate of approximately 149 ft/yr toward the center of the site. Plumes A and B probably are moving to the center of the site toward the two troughs and are potentially co-mingling in the Plume C area. The downgradient-most well in the trough to the northwest of the installation (MW-43, located off the Depot boundary in the downgradient location) has only trace levels of chloroform at 2 µg/L. Contamination is not found to move toward the southern trough in measurable concentrations. No other VOCs, except carbon disulfide at a trace level of 1 µg/L, have been detected in MW-24, which is the downgradient well in the trough in the south-central section of the Main Installation. Thus, with regard to off-site locations to the south, little or no migration of groundwater contaminants through the trough would occur.

The wells MW-43, MW-34, and MW-38 are in an area of potential vertical migration to the underlying confined sand (possibly the Memphis) aquifer; however additional characterization is being performed at Dunn Field to evaluate whether downward migration is occurring here. Off-site migration is occurring through the depressed clay surface aligned with wells MW-43, MW-34, and MW-38. Small amounts of degradation products were detected in the site groundwater. Some of the more toxic degradation products (such as vinyl chloride), however, were not detected in the site groundwater. The potential for volatilization exposures through the ground surface for the CVOCs in groundwater is negligible, because of the impervious nature of surface soils in the area, the depth to groundwater (greater than 50-ft depths), and the low levels of the COPCs detected. Considering the historical nature of VOC releases at the site (55 years), potential migration to off-site areas would have occurred by now. However, estimated chemical-specific migration rates (Table 33-1) indicate the maximum likely distances the CVOCs could reach. The monitoring data for the off-site areas show that the site constituents are not reaching off-site areas in measurable levels.

There is no residential groundwater use on the Depot or in the surrounding community under current or foreseeable future land use conditions. Drinking water is supplied by MLGW pumping wells in the Memphis aquifer. Currently, site groundwater is not being used for industrial use at the Depot. Because of the availability of municipal water supplies, the groundwater is not likely to be used for drinking in the foreseeable future, even if site operations were to be altered to a different industrial use; i.e., redevelopment of the Depot.

Table 34-2 summarizes hypothetical future exposure pathways for FU7 and identifies the pathways that will be evaluated quantitatively in this RA. The potential receptors evaluated for potable water use are:

- Hypothetical future industrial worker; and
- Hypothetical future on-site resident-adult and child (for comparison purposes only).

Maximum and average concentrations were estimated for groundwater from each plume for chemicals that exhibit plume behavior (i.e., CVOCs). For chemicals that do not occur

as plumes (i.e., inorganic chemicals), the upperbound exposure concentration was estimated using the UCL 95% concentrations on the mean for all wells associated with the Main Installation. The estimated concentrations, referred to as EPCs, are listed in Tables 34-3 and 34-4. The dose (intake) was estimated for each of the complete exposure pathways and included in Appendix I. The exposure assumptions are standard default factors. For example, ingestion rates of 2 L/day for an adult and 1 L/day for a child and industrial worker were used. Exposure frequency is assumed to be 350 days per year for residential receptors and 250 days per year for industrial receptors. All assumptions are presented in Appendix G.

An oral exposure dose was estimated for organic and inorganic COPCs. The dose estimates are used for comparison with the CSFs and the RfDs to estimate risks and hazards. Inhalation exposure to the CVOCs was assumed equal to the oral dose to estimate intake. Inorganic COPCs were evaluated for oral and dermal doses.

### **34.1.3 Toxicity Assessment**

Table 34-5 presents toxicity values from EPA toxicity factor sources for all of the COPCs at FU7.

Oral CSFs are available for 1,1,2,2-Tetrachloroethane, arsenic, chloroethane, chloromethane, dibromochloromethane, PCE, and TCE. Inhalation CSFs are available for 1,1,2,2-Tetrachloroethane, arsenic, beryllium, cadmium, chloromethane, chromium (total), PCE, and TCE. Chronic oral RfDs are available for aluminum, arsenic, beryllium, cadmium, chlorobenzene, chloroethane, chromium (total), dibromochloromethane, manganese, nickel, PCE, TCE, and vanadium. Inhalation RfDs are available for chlorobenzene, chloroethane, and PCE. Oral toxicity factors were reduced by the gastrointestinal dermal absorption ( $ABS_{GI}$ ) factors for comparisons with dermal intake estimates. These values can be found in Table 7-10. Ten carcinogenic and five noncarcinogenic inorganic and organic chemicals were identified as COPCs at FU7. All of the chemicals were analyzed for their potential toxicity contribution to represent the combined effect of all site-related chemicals.

### **34.1.4 Risk Characterization**

Estimates of ELCR and noncarcinogenic health hazards are summarized for all of the COPCs on a route- and receptor-specific basis for FU7 in Tables 34-6 (average VOC plume concentrations) and 34-7 (maximum VOC plume concentrations). Appendix I provides detailed risk calculations, along with histograms of the risks and the HIs per receptor group. For the chemicals that do not occur as plumes (e.g., inorganic COPCs), the EPC was estimated as the UCL 95% concentration across the Main Installation, and one set of risk and HI values was estimated for the entire Main Installation area. Three sets of risk and HI calculations were performed for organic COPCs for Plumes A, B, and C. The average concentrations within each of the three organic plumes combined with inorganic risks and HIs across the Depot are included in Table 34-6. The maximum

concentration within each of the three plumes, combined with inorganic risks and HIs across the Depot, are included in Table 34-7. The ELCR estimates for a future industrial worker exposure to Plumes A, B, or C are  $2 \times 10^{-5}$  each, and the HI is below 1.0. The risk driver within the site-wide inorganics is arsenic. The risk drivers for all organic plumes are PCE and 1,1,2,2-Tetrachloroethane (with the exception of Plume A, which is PCE only). The risks from maximum organic COPC concentrations within Plumes A, B, and C are  $4 \times 10^{-5}$ ,  $2 \times 10^{-5}$ , and  $2 \times 10^{-5}$ , respectively. The carcinogenic risks are within the acceptable risk limit range; noncarcinogenic HIs for Plumes A, B, and C, respectively, are 0.6, 0.6, and 0.5, all of which are below 1.0. Figures 34-1 and 34-2 present the risks and HIs for an industrial worker from groundwater use at the Main Installation.

For exposure to site-wide inorganics and organics at average concentrations from either Plume A or B, the ELCR to a future hypothetical residential adult is  $9 \times 10^{-5}$  and the HI is 1.0. Plume C resulted in an ELCR of  $7 \times 10^{-5}$  and an HI of 1.0. The risk driver within the site-wide inorganics is arsenic. The risk drivers for all organic plumes are PCE and TCE, including 1,1,2,2-Tetrachloroethane, for Plumes B and C, and dibromochloromethane for Plume C. The risks to a hypothetical residential adult from exposures to the maximum concentrations estimated from Plumes A, B, and C are  $2 \times 10^{-4}$ ,  $1 \times 10^{-5}$ , and  $8 \times 10^{-5}$ , respectively. The risks are either above or near the upper limit of the acceptable risk range, indicating that groundwater within the plume area is unfit for drinking.

For exposure to site-wide inorganics and average concentrations of organics from Plumes A, B, or C, the ELCR to a future hypothetical residential child is  $3 \times 10^{-5}$  and the HI is 3.0. The risk driver within the site-wide inorganics is arsenic. The risk drivers for all organic plumes are PCE, TCE, and 1,1,2,2-Tetrachloroethane (with the exception of Plume A, which is PCE only). For exposure to site-wide inorganics and organics at maximum concentrations from Plume A, B, or C, the ELCRs for a future hypothetical residential child are  $6 \times 10^{-5}$ ,  $4 \times 10^{-5}$ , and  $3 \times 10^{-5}$ , respectively. The HIs are 4.0 for Plumes A and B and 3.0 for Plume C. The risk driver within the site-wide inorganics is arsenic.

Groundwater is not currently used for potable purposes at the site. Overall, risks to a future industrial worker or hypothetical resident from exposure to average concentrations present risks that are within the 1 to 100 in a million risk range ( $10^{-6}$  to  $10^{-4}$ ). Risks from maximum concentrations, on the other hand, are slightly above the upper limit of the acceptable risk levels, while the HI is at or below 1.0. Although there is no intent to use groundwater as potable water in the future, any plans for future use would have to be carefully evaluated.

In addition to baseline RA results, the following factors also must be considered for future site management decisions:

- Distance to the potential exposure point for the observed plume(s); and
- Time required for the plume(s) to attenuate below MCLs at the identified point of exposure.

There are no residential or industrial groundwater users within the site. The downgradient location of the nearest potential receptor is not clearly known, but in a well survey none were identified between the Depot and the Allen Well Field (see Figure 2-14). A conservative assumption regarding exposure is that fluvial groundwater enters the Memphis aquifer in the northwestern portion of the Depot, where it is eventually pumped and potentially enters the City of Memphis drinking water supply. It should be stressed that this assumption has not been verified in evaluating groundwater at the Depot or in monitoring wells at the Allen Well Field.

As discussed in Section 33.5.1, transport calculations indicate that CVOCs from the southwestern and southeastern portions of the Main Installation are not reaching (in measurable quantities) the low in the potentiometric surface in the vicinity of MW-34. Evaluation of the plume configuration, based on monitoring data, confirms this calculated result. Concentrations of PCE from the southwestern portion of the Main Installation (MW-21) have decreased by about a factor of 50 at the most downgradient well where PCE was detected (MW-39)—a distance of about 2,200 ft (see Figure 32-2). Similar reductions in concentrations would be expected along the 2,000-ft distance from MW-39 to the potentiometric low at MW-34. Additional order-of-magnitude concentration reductions are expected over the approximately 1.5-mile distance from the Depot to the Allen Well Field. Because no TCE or PCE, or their degradation products, were detected in these downgradient wells, future migration in detectable levels is highly unlikely.

The groundwater within areas of organic contamination is not usable for potable purposes because of the presence of CVOCs. Although site groundwater has low-level CVOc contamination, the shallow aquifer is not used for residential or industrial potable use at the Depot or within the surrounding community. Because of this lack of exposure, risks are not considered significant.

**THIS PAGE INTENTIONALLY LEFT BLANK.**

TABLE 34-1

Constituents of Potential Concern in FU7 - Groundwater  
 Memphis Depot Main Installation RI

| Unit                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Matrix | Units | Parameter Name            | Number Analyzed | Number Detected | Minimum Detection Limit | Maximum Detection Limit | Minimum Detected Concentration | Maximum Detected Concentration | Arithmetic Mean Detected Concentration | Background Concentration | Regulatory Criteria for Groundwater | COPC/BASIS |   |

Note: Organic constituents have been evaluated from plume-specific data, and arithmetic means have been used for EPC values.

All units are mg/L.

Plume A consists of the following wells: HY02, MW21, MW22, MW23, MW47 &amp; PZ04

Plume B consists of the following wells: HY03, HY04, MW25, MW26, MW64 &amp; PZ05

Plume C consists of the following wells: MW34, MW43, MW38, MW39, MW62, MW63 &amp; PZ03

| <b>Notes:</b><br>* Inhalation exposures to volatiles in the groundwater are equal to the ingestion exposures as per EPA Region IV policy<br>a Default exposure factors adapted from EPA, Human Health Evaluation Manual, Supplemental Guidance: "Standard Default Exposure Factors" OSWER Directive 9285.6-03, March 25, 1991.<br>b Worker groundwater exposure is adapted from EPA Exposure Factor Handbook, August 1997 & is protective of 1/2 head (face), hands & forearms. (see Appendix L)<br>c Residential adult total body surface area is adapted from EPA Exposure Factor Handbook, August 1997 & is protective of all body parts. (see Appendix L)<br>d Residential child total body surface area is adapted from EPA Exposure Factor Handbook, August 1997 & is protective of all body parts. (see Appendix L)<br>e Calculation for Shower dermal exposure time: 10 minute event x 1 hour/60 minutes x 1 day/ 24 hours = 0.007 event/day<br>f Age-adjusted ingestion rate for residential adult: $IR_{adj} = \frac{IR_c \times ED_c}{BW_c} + \frac{IR_a \times (EDA - ED_c)}{BW_a}$ $= \frac{1 \times 6}{15} + \frac{2 \times (30-6)}{70}$ $= 1.09 \text{ (L-year)/(kg-day)}$ g Age-adjusted dermal contact for residential adult: $SA_{adj} = \frac{SA_c \times ED_c}{BW_c} + \frac{SA_a \times (EDA - ED_c)}{BW_a}$ $= \frac{6557 \times 6}{15} + \frac{20000 \times (30-6)}{70}$ $= 9480 \text{ (cm}^2\text{-year)/(kg)}$<br>cm <sup>2</sup> centimeters squared<br>days/year days per year<br>hours/day hours per day<br>kg kilograms<br>L/day liters per day<br>m <sup>3</sup> /day cubic meters per day<br>N/A Not applicable for this receptor |                                                   |                   |   |                         |     |                         |   |

A decorative graphic on the left side of the page consists of several overlapping rectangles. A large red rectangle is positioned in the middle-left. Above it, a dark gray rectangle extends from the top edge. Below the red rectangle, a light gray rectangle extends from the bottom edge. To the right of the red rectangle, a black rectangle is positioned at the bottom. The text 'Attachment F' and its subtitle are located to the right of the red rectangle.

**Notes:**

<sup>a</sup>Because of the low number of detected concentrations, the background value, based on twice the mean detected value, exceeds the maximum detected value.

LN Background is the UCL95 value based on a lognormal distribution.

µg/kg Micrograms per kilogram

µg/L Micrograms per liter

mg/kg Milligrams per kilogram

ng/L Nanograms per liter

NO Background is the UCL95 value based on a normal distribution.

NP Background is the maximum value based on nonparametric distribution.

PCB Polychlorinated biphenyl

SVOC Semivolatile organic compound

UCL95 95th percentile upper confidence level on mean concentration

VOC Volatile organic compound

**Notes:**

Exposure point concentrations were taken from the 2000 DDMT Main Installation Remedial Investigation Report tables and compared to the current USEPA Regional Screening Levels (RSL) to determine if there are any exceedances. Values are estimated due to unclear scanned version of data.

**USEPA RSLs at a target cancer risk of 1E-06 and target hazard quotient of 0.1 are applied to identify exceedances.** The RSLs listed for chromium are Cr (III) and Cr (VI), respectively; data were compared to the Cr(VI) RSLs. The RSLs listed for 1,2-Dichloroethene (DCE) are trans-1,2-DCE and cis-1,2-DCE, respectively; data were compared to the cis-1,2-DCE RSLs. The RSLs listed for TPH are for low aromatics; data were compared to low aromatic TPH RSL.

A majority of the Site, FU-1 to FU-5, is designated for industrial use by LUCs and the evaluation applies the Industrial Soil RSLs to identify exceedances. Limited areas of FU-6 are designated as residential and the evaluation applies both of the Industrial and Residential Soil RSLs to identify exceedances in FU-6.

Exceedances of the USEPA Residential Soil RSL are highlighted and bold.

Exceedances of the USEPA Industrial Soil RSLs are highlighted and underlined.

**Abbreviations:**

ft -- feet  
FU -- functional unit  
mg/kg -- milligrams per kilogram

**RSL Basis:**

\* -- Where noncancer RSL < 100 times cancer RSL  
\*\* -- Where noncancer RSL < 10 times cancer RSL  
c -- Cancer  
L -- See RSL User's Guide - RSL calculated using blood-lead modeling  
m -- RSL may exceed ceiling limit  
n -- Noncancer  
R -- See RSL User's Guide - RSL calculated using relative bioavailability factor  
s -- RSL may exceed Csat

**Notes:**  
Exposure point concentrations (EPCs) were taken from the 2000 DDMT Main Installation Remedial Investigation Report tables and compared to the current USEPA Regional Screening Levels (RSL). Values are estimated due to unclear scanned version of data.

**USEPA RSLs at a target cancer risk of 1E-06 and target hazard quotient of 1 are applied to calculate screening risks and hazards.** The RSLs listed for chromium are Cr (III) and Cr (VI), respectively; data were compared to the Cr(VI) RSLs. The RSLs listed for 1,2-Dichloroethene (DCE) are trans-1,2-DCE and cis-1,2-DCE, respectively; data were compared to the cis-1,2-DCE RSLs. The RSLs listed for TPH are for low aromatics; data were compared to low aromatic TPH RSL.

A majority of the Site is designated for industrial use by LUCs and the evaluation applies the Industrial Soil RSLs to calculate screening risks and hazards. Limited areas of FU-6 are designated as residential and the evaluation applies the Residential Soil RSLs to calculate screening risks and hazards in FU-6.

The risk and hazard equations are as follows:

$$Risk = \frac{EPC}{RSL_{Cancer}} \times Target Risk$$

and

$$Hazard = \frac{EPC}{RSL_{Noncancer}} \times Target Hazard Quotient$$

where target risk is 1E-06 and target hazard quotient is 1.

**Abbreviations:**  
ft -- feet  
FU -- functional unit  
mg/kg -- milligrams per kilogram

**Notes:**

The final confirmation samples results, post-excavation, are presented. Detected concentrations (units of mg/kg) were taken from the 2002 DDMT Remediation Report Removal Action at Building 949, Table B-2 for FU-4 and compared to the current USEPA Regional Screening Levels (RSL) to determine if there are any exceedances.

USEPA RSLs at a target cancer risk of 1E-06 and target hazard quotient of 0.1 are applied. The RSLs listed for chromium are Cr (III) and Cr (VI). Data were compared to the Cr(VI) RSLs.

There are no exceedances of the USEPA Industrial Soil RSLs for lead and Cr (III). All chromium results exceed the Cr (VI) Industrial Soil RSL.

**References:**

USEPA. 2018. Regional Screening Levels (RSLs) - Generic Tables. November. Available online: <https://www.epa.gov/risk/regional-screening-levels-rsls>

**RSL Basis:**

\* -- Where noncancer RSL < 100 times cancer RSL

c -- Cancer

L -- See RSL User's Guide - RSL calculated using blood-lead modeling

m -- RSL may exceed ceiling limit

n -- Noncancer

Table 3

Removal Action Parcels 35 28 in FU-3 – Comparison of Area B Soil Confirmation Sampling Analytical Results to Human Health Screening Criteria  
Human Health and Ecological Risk Assessment  
Main Installation - Defense Depot Memphis, Tennessee

**Notes:**

Detected concentrations (units of mg/kg) were taken from shallow soil confirmation sample results from the 2000 DDMT Remediation Report Removal Action in Parcels 35 and 28, Table B-2 for FU-3 and compared to the current USEPA Regional Screening Levels (RSL) to determine if there are any exceedances. Values are estimated due to unclear scanned version of data.

**USEPA RSLs at a target cancer risk of 1E-06 and target hazard quotient of 0.1 are applied.** The RSLs listed for chromium are Cr (III) and Cr (VI), respectively. Data were compared to the Cr(VI) RSLs.

Exceedances of the USEPA Industrial Soil RSLs are highlighted and underlined.

**Abbreviations:**

D -- Diluted concentration

J -- Estimated concentration

NA -- Not available

ND -- Nondetected concentration

**References:**

USEPA. 2018. Regional Screening Levels (RSLs) - Generic Tables. November. Available online: <https://www.epa.gov/risk/regional-screening-levels-rsls>

**RSL Basis:**

\* -- Where noncancer RSL < 100 times cancer RSL

\*\* -- Where noncancer RSL < 10 times cancer RSL

c -- Cancer

L -- See RSL User's Guide - RSL calculated using blood-lead modeling

m -- RSL may exceed ceiling limit

n -- Noncancer

R -- See RSL User's Guide - RSL calculated using relative bioavailability factor

s -- RSL may exceed Csat

Table 4

Removal Action Parcels 35 28 in FU-3 – Comparison of Trench Soil Confirmation Sampling Analytical Results to Human Health Screening Criteria  
Human Health and Ecological Risk Assessment  
Main Installation - Defense Depot Memphis, Tennessee

**Notes:**

Detected concentrations (units of mg/kg) were taken from trench soil confirmation sample results from the 2000 DDMT Remediation Report Removal Action in Parcels 35 and 28, Table B-4 for FU-3 and compared to the current USEPA Regional Screening Levels (RSL) to determine if there are any exceedances. Values are estimated due to unclear scanned version of data.

USEPA RSLs at a target cancer risk of 1E-06 and target hazard quotient of 0.1 are applied. The RSLs listed for chromium are Cr (III) and Cr (VI), respectively; data were compared to the Cr(VI) RSLs. The RSLs listed for 1,2-Dichloroethene (DCE) are trans-1,2-DCE and cis-1,2-DCE, respectively; data were compared to the cis-1,2-DCE RSLs. Exceedances of the USEPA Industrial Soil RSLs are highlighted and underlined.

**Abbreviations:**

J -- Estimated concentration  
ND -- Nondetected concentration

**References:**

USEPA. 2018. Regional Screening Levels (RSLs) - Generic Tables. November. Available online: <https://www.epa.gov/risk/regional-screening-levels-rsls>

**RSL Basis:**

\* -- Where noncancer RSL < 100 times cancer RSL  
\*\* -- Where noncancer RSL < 10 times cancer RSL  
c -- Cancer  
L -- See RSL User's Guide - RSL calculated using blood-lead modeling  
m -- RSL may exceed ceiling limit  
n -- Noncancer  
R -- See RSL User's Guide - RSL calculated using relative bioavailability factor  
s -- RSL may exceed Csat

### LEGEND

-  EXCAVATION AREA A:  
EXCAVATE 12" SOIL TO  
LIMITS DEFINED BY  
RESIDENTIAL CLEANUP  
CRITERIA: CONFIRMATORY  
SAMPLE, BACKFILL WITH  
GENERAL FILL; SEED.  
(SEE NOTE 2)
-  EXCAVATION AREA B:  
EXCAVATE 12" SOIL TO  
LIMITS DEFINED BY  
INDUSTRIAL CLEANUP  
CRITERIA: CONFIRMATORY  
SAMPLE; BACKFILL WITH  
GENERAL FILL AND 6" OF  
AGGREGATE SURFACE  
COURSE. (SEE NOTE 3.)
-  TRENCH EXCAVATIONS  
EXCAVATE TO LIMITS  
SHOWN ON SHEET 4;  
CONFIRMATORY SAMPLE;  
BACKFILL WITH GENERAL  
FILL AND 6" OF  
AGGREGATE SURFACE  
COURSE. (SEE NOTE 3)
- EXISTING SAMPLING  
LOCATIONS
- ⊗ ADDITIONAL  
PRE-CONSTRUCTION  
SAMPLING LOCATIONS:  
SAMPLE IN ADDITION TO  
EXCAVATION SITE  
COMPOSITE SAMPLING.  
(SEE NOTE 1.)

NOTES:

1. EXCAVATION LIMITS ARE APPROXIMATE. CONTRACTOR SHALL LAY OUT LOCATIONS IN THE FIELD AND OBTAIN PRE-CONSTRUCTION SCREENING SAMPLES IN ACCORDANCE WITH SPECIFICATION SECTION 02111, EXCAVATION AND HANDLING OF CONTAMINATED SOIL, PRIOR TO OTHER WORK IN AREAS A. (SEE NOTE 4)
2. ACTUAL EXCAVATION REQUIREMENTS AND LIMITS IN AREA A WILL BE DETERMINED BY THE CONTRACTING OFFICER'S REPRESENTATIVE BASED ON REVIEW OF ANALYTICAL RESULTS FROM PRE-CONSTRUCTION SAMPLING
3. BACKFILL TO WITHIN 6" OF SURFACE WITH COMPACTED GENERAL FILL, AND BACKFILL REMAINDER OF EXCAVATION WITH 6" OF COMPACTED AGGREGATE SURFACE COURSE.
4. IF EXCAVATION IS REQUIRED IN AREA A, INSTALL TEMPORARY FENCE BEFORE START OF EXCAVATION

**Notes:**

Maximum detected concentrations were taken from the 2000 DDMT Main Installation Remedial Investigation Report tables and compared to the current USEPA Region 4 Ecological Screening Values to determine if exceedances have changed.

Exceedances of the ecological screening values are highlighted and bold.

The original criteria applied in the 2000 SLERA are from the memorandum "Ecological Risk Assessment at Military Bases: Process Consideration, Timing of Activities and Inclusion of Stakeholders" from USEPA Region 4 (December 22, 1998).

**Abbreviations:**

\* -- Criteria for total polycyclic aromatic hydrocarbons (PAHs), 0.29 mg/kg for low-molecular weight and 1.1 mg/kg for high-molecular weight PAHs.

^^ -- Criteria for dioxins/furans

FU -- Functional Unit

J -- Estimated concentration

NA -- Not available

#### Notes:

Maximum detected concentrations were taken from the 2000 DDMT Main Installation Remedial Investigation Report tables and compared to the current USEPA Region 4 Ecological Screening Values to determine if exceedances have changed.

Exceedances of the Narcotic Mode values are highlighted and bold and exceedances of the Non-Narcotic Mode values are highlighted and underlined.

The original criteria applied in the 2000 SLERA are from the memorandum "Ecological Risk Assessment at Military Bases: Process Consideration, Timing of Activities and Inclusion of Stakeholders" from USEPA Region 4 (December 22, 1998).

#### Abbreviations:

\* -- Criteria for total polycyclic aromatic hydrocarbons (PAHs)

^ -- Criteria for total polychlorinated biphenyls (PCBs)

^^ -- Criteria for chlordane

^^^ -- Criteria for dioxins/furans

FU -- Functional Unit

J -- Estimated concentration

NA -- Not available

**Notes:**

Maximum detected concentrations were taken from the 2000 DDMT Main Installation Remedial Investigation Report tables and compared to the current USEPA Region 4 Ecological Screening Values to determine if exceedances have changed.

Exceedances of the Acute Screening Values are highlighted and bold and exceedances of the Chronic Screening Values are highlighted and underlined.

The original criteria applied in the 2000 SLERA are from the memorandum "Ecological Risk Assessment at Military Bases: Process Consideration, Timing of Activities and Inclusion of Stakeholders" from USEPA Region 4 (December 22, 1998).

**Abbreviations:**

\*\* -- Criteria for chromium III / chromium VI

^^^ -- Criteria for dioxins/furans

# -- Criteria for total or dissolved metals; dissolved criteria based on default hardness of 50 mg/L as CaCO<sub>3</sub>.

FU -- Functional Unit

J -- Estimated concentration

NA -- Not available

EPA Conditional Approval  
Letter and Responses to  
EPA Comments on HHERA  
Rev0

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY  
REGION 4  
ATLANTA FEDERAL CENTER  
61 FORSYTH STREET  
ATLANTA, GEORGIA 30303-8960

April 29, 2019

Mr. James Foster  
Base Realignment and Closure Division (ACSIM-ODB)  
2530 Crystal Drive (Taylor Building), Room 5000  
Arlington, VA 22202-3940

Dear Mr. Foster:

The U.S. Environmental Protection Agency (EPA) has received and reviewed the U.S. Department of the Army's Revised Responses to EPA Comments dated December 11, 2018 which were in response to EPA Comments, dated July 23, 2018 on the Human Health and Ecological Risk Assessment (HHERA) dated April 2018.

The U.S. EPA and the U.S. Army had several teleconferences on April 12, 2019 and April 26, 2019 to discuss the previously noted concerns outlined by EPA Comment Letter dated April 08, 2019. EPA and the Army have agreed upon path forward based on our April 2019 teleconferences and EPA has agreed to extend a conditional approval for the above mentioned report with the understanding that the comments noted below will be addressed in future HHERA submittals. EPA has reattached the comments below for reference and clarity only.

- US Army will address EPA comments I. 5, 6, 7, 10; II. 3, 6, 7, 15a, 16; IV. 1, 2 and 4 through Revision 1 of the 2018 HHERA
- US Army will address the remaining EPA comments through the upcoming VI study and/or additional review, sampling and risk assessment performed under the new task order and this data will be captured in the future HHERA submittal

Should you have any questions or concerns, please feel free to call me at on my cell number 404-229-9500.

Sincerely,

A handwritten signature in black ink, appearing to read "Diedre Lloyd", is written over a horizontal line.

**US EPA RESPONSES TO US ARMY COMMENTS (December 11, 2018) on the  
HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT  
REVISION 0**

**MAIN INSTALLATION  
APRIL 2018**

**DEFENSE DEPOT  
MEMPHIS, TENNESSEE**

---

**General Comments:**

- 1) EPA notes that a revised HHRA was not provided for review; therefore, the revisions to the HHRA proposed in the US Army responses to EPA could not be fully evaluated. The US Army provided three proposed resolutions as outlined in three bullets below in italics:
- a) *Comment accepted and will be addressed through changes made in Revision 1 of the 2018 HHRA: Comments I. 5, 6, 7, 10; II. 3, 6, 7, 15a, 16; IV. 1, 2 and 4.*
  - b) *Comment accepted and will be addressed through the VI study and/or additional review, sampling and risk assessment performed under the new task order: I. 1, 2, 4, 8, 9; II. 1, 2, 8 – 14, 15b; III. 1; IV. 3; V.1-5.*
  - c) *Comment not considered to require revision to the 2018 HHRA or additional assessment: I. 3; II. 4, 5; VI. 1.*

**Bullet 1: EPA awaits the opportunity to provide review of the HHRA revisions outlined in this bullet**

**Bullet 2: See Comment # 3 below, inclusive of all subparts**

**Bullet 3: See responses below and EPA ecological risk assessor responses below** (previously sent in a preliminary email)

- 2) **Evaluation of the Response to Human Health Risk Assessment (HHRA) General Comment 6:**  
The response partially addresses the comment. Noting that concentrations of dieldrin, Aroclor 1260, arsenic, and various polycyclic aromatic hydrocarbons are present in soil at Functional Unit (FU) 6 at concentrations exceeding the EPA Regional Screening Level (RSL) for residential soil, it is unclear if the unrestricted use designation for a portion of FU-6 is appropriate. It is noted that Section 8.5, Conclusions, and Section 10.2, Soil HHRA Review, state, “the current Soil HHRA review found that most organic and inorganic constituents detected at the former Depot are present at levels that do not exceed current Industrial RSLs. Therefore...it does not appear that a revised soils-only HHRA is necessary in order to adequately assess potential incremental health risks and assure protectiveness of the remedy.” However, no assessment regarding whether the conclusions of the Soils HHRA remain valid for the unrestricted use portions of FU-6 is presented, including whether the remedial actions completed since that time are protective of applicable receptor populations (which have the potential to include residential users).
- a) Ensure that revisions to the Human Health and Ecological Risk Assessment, Revision 0, Main Installation, dated April 2018 (the HHRA) include an evaluation of whether the conclusions of the 2000 Soils HHRA are still valid for the unrestricted use portion of FU-6,

and discuss whether the remedial actions completed since that time are protective of applicable receptor populations.

- 3) Evaluation of the Response to Ecological Risk Assessment (ERA) General Comment 1 and Specific Comment 3:** The response partially addresses the comment. For example, the responses indicate that the need for conducting a Screening Level Ecological Risk Assessment (SLERA) will be evaluated and recommendations provided in an updated HHERA. However, this is a vague statement and should be further described. It is generally accepted that conducting a SLERA is one of the first steps in the ERA process. A situation in which this might not be the case is during the first site visit and problem formulation steps, which determines that there are no complete ecological receptor exposure pathways associated with the site. This is often documented in using a formal ecological scoping checklist/evaluation.
- a) It is recommended that the SLERA-related evaluation of responses to comments include specific references to ERA methods (EPA and/or site-specific) and location/application of scientific management decision points (with respect to the 8-step ERA process) associated with evaluating the need to conduct a SLERA. This inclusion will be useful in saving time and resources needed to comment/respond to any potential issues associated with inappropriate application of standard or site-specific guidance in the updated HHERA.
  - b) As noted in Human Health Risk Assessment (HHRA) General Comment (GC) 2, an assessment of vapor intrusion (VI) potential predicated on residential exposure assumptions have not been conducted for the eastern parcel, which is available for unrestricted use. GC 2 requested that groundwater concentrations detected on and in the vicinity of this parcel be evaluated for VI potential using residential-use based screening criteria. The response to GC 2 states that no change to the HHERA is necessary, as a VI study is ongoing [as documented in the Memorandum: Soil Vapor Sampling, Main Installation Vapor Intrusion Study, dated January 15, 2019 (hereinafter the 2019 VI Memo)]. The response goes on to state that soil gas samples collected in August 2018 were collected at locations considered most likely to contain volatile organic compounds in soil and/or groundwater at concentrations that may result in unacceptable vapor intrusion risk, and that soil gas data will be evaluated using residential use-based screening criteria. However, EPA notes that numerous issues were identified in review of the 2019 VI Memo related to the response to GC 2. These included the following:
    - No soil gas sampling was conducted at the eastern parcel specifically; and,
    - It is unclear if the current assessment did, in fact, characterize those areas that had the potential to present the greatest vapor intrusion risk as stated in the response to GC 2.
  - c) EPA understands that additional vapor intrusion sampling is currently proposed based on the results of the initial soil gas sampling presented in the 2019 VI Memo. As part of that effort, EPA strongly recommends that the potential for VI to occur on the eastern parcel of the property be properly assessed to ensure the protection of human health and the environment.

**1<sup>ST</sup> Iteration – Sharon Thom’s Comments, as outlined in preliminary EPA email dated February 18, 2019 at 8:40 am (DOD and Army have been used interchangeably in this section)**

- 4)** The DoD in their responses said they were in the process of conducting a vapor intrusion study. DoD agreed to review the existing data and decide whether to collect additional analytical data, in which case DoD would prepare a QAPP. The comment pertains primarily to the areas where dioxins/furans were detected in shallow and deeper soils of a portion of FU3 and FU4 as well as in other media. This was **comment 13 in Section II.** The DoD response lacks specificity and does not fully address

EPA's comment that requests a complete description with figures showing where the dioxin/furan exceedances occur and to identify the other media that are impacted. Figures are needed for the off-site waterways that are impacted by dioxin/furans in sediment.

- a) EPA requests more than a data review - an update to the conceptual site model is needed to address potential transport of site-related contamination to off-site waterways.

**5) In Comment 1 in Section III**

- a) EPA requests that DoD calculate hazard quotients (HQs) for constituents that exceed their respective ecological screening levels

**6) Appendix G:** DoD responded that the recommendation to perform a screening-level ecological risk assessment (SLERA) will be evaluated following additional sampling and human health risk assessment.

- a) The EPA comment requests that data presented in Appendix G be screened against the March 2018 Region 4 Supplemental Ecological Risk Assessment Guidance. However, the data in Appendix G was screened against the current RSLs for human health.
  - i. Please ensure that a revised Table as described above, specifically, a table that is screened against the March 2018 R4 Supplemental Ecological Risk Assessment Guidance is included in the revised submittal.
- b) The text described the constituents that exceeded the screening values, but the backup information to support the conclusions was not presented in Appendix G.
- c) The DoD response did not agree to revise Appendix G to address this deficiency unless new data were collected at which time probably only the new data would be screened, if and only if there was some indication this was necessary based on the human health risk assessment conclusions.
  - i. Please indicate that this table will also be revised in subsequent submittals
- d) In order for EPA to evaluate this issue, DOD needs to provide the requested data as outlined in this comment. DOD stated purpose of the submitted HHERA was to evaluate the former risk assessments against updates to the EPA risk assessment guidances. The results of the screening with the 2018 guidance compared to the results of the 2000 SLERA are not substantially different from the calculations that EPA Ecological Risk Assessor (S. Thom) has completed. However, DoD has not adequately supported their conclusions in the main text and had not provided the supporting information in the Appendix G data table.
  - i. Please provide the requested information and additional specificity as requested.

**7) Comment 3 in Section IV** contains contradictory information and data appears to be missing that potentially obscures the implications. The comment refers to Section 9.4 of the HHERA that stated:

- a) There is the potential for COCs to be conveyed off-site via stormwater runoff, as noted in the MI RI. While the watershed assessment indicates that runoff from the MI is not likely to have a significant impact on the ability of local surface water bodies to support wildlife and aquatic-dependent species or habitat, the detection of dioxin/furans in on-site soil, as well as in surface water and sediment in local streams warrants additional study.
  - i. Please provide additional data that clarifies this issue

**8) Comment 3 in Section IV** requested an evaluation of the exposure to offsite receptors from dioxin/furans in surface soils and on-site drainage pathways through erosion and transport to offsite waterways. The DoD response stated that inconsistencies would be eliminated.

- a) However, the response did not clarify how they would be eliminated. It is unclear if there are ecological exposures to the contaminants on-site. However, the site is not protective if site-related contamination is washing off and entering off-site waterways where there is the potential for downstream transport and exposure to receptors. The DoD response is not specific and does not describe what actions will be taken to address the EPA comment.

- i. DoD needs to support assertions that the pentachlorophenol and dioxin/furans detected in the sediments and/or surface water of the off-site waterways do not present an ecological risk. EPA requests that DoD include a SLERA at a minimum to address this concern.
- ii. If DoD thinks that the data is old, they might want to collect more sediment and analyze for pentachlorophenol and dioxins/furans.

**9) Section V Comments 1 – 5 were not addressed.** EPA requests the rationale for a SLERA subsequent to the evaluation and updated HHRA. EPA is concerned that contamination in surface water and sediments could present an ecological and potentially human health risk from an off-site waterway.

**10) In comment 5, Section V,** I was trying to give a relatively simple way to think about soil contamination as a potential source of contamination in surface water runoff. The guidance document that was cited in the DoD response pertains to estimating the amount of pollution reduced by a Superfund remedy. It does not apply to the particular situation here.

- a) Because the DDMT site is mainly buildings and pavement with some grass, most rainfall will become runoff. The sediments delivered in the runoff will have contaminant concentrations reflecting the concentrations in the top inch or so of soil. The average concentration in the surface soil is a good predictor of the concentrations in the sediment that is washed off the site. A remedy to address stormwater runoff and sediment transport could serve this site well.
  - i. EPA suggests: A more thorough method to address this comment would be to run the universal soil loss equation.

**11) In conclusion:**

- a) The Army needs to outline specifically what actions and data will be collected to characterize dioxins/furans and pentachlorophenol in FU3 & FU4 soils or in sediments and surface water of the off-site waterways.
- b) The Army needs to outline specifically what actions, reports and data will be collected in the upcoming HHRA to ensure that all parties are “on the same page” to ensure DQOs are met to ensure site protectiveness of human health and the environment
- c) The Army needs to revise the HHRA to include the updated SLERA with the new ecological screening values.

**Responses to Comments from  
U.S. Environmental Protection Agency (EPA) Region 4 on:  
Human Health and Ecological Risk Assessment (HHERA), Revision 0  
Defense Depot Memphis, Tennessee  
Comments Received 23 July 2018  
Responses Revised 11 December 2018**

The baseline risk assessment for the Main Installation at DDMT was presented in the Main Installation Remedial Investigation (CH2M HILL 2000). The primary task of the HHERA was to update the groundwater component of the 2000 HHRA; secondary tasks were to review the soil component of the 2000 HHRA and the 2000 SLERAs based on current conditions and guidance.

Responses to EPA comments on the HHERA Rev0 are provided below. Many of the comments identify issues that were not fully considered in the HHERA. In many cases, that is because the HHERA did not include updates to the soil HHRA or the SLERA. Section 10 of the HHERA presents recommendations for additional work which is to be performed in a separate task order to be awarded in late 2018.

As noted in the specific responses below, the comments have one of three proposed resolutions:

- Comment accepted and will be addressed through changes made in Revision 1 of the 2018 HHERA: Comments I. 5, 6, 7, 10; II. 3, 6, 7, 15a, 16; IV. 1, 2 and 4.
- Comment accepted and will be addressed through the VI study and/or additional review, sampling and risk assessment performed under the new task order: I. 1, 2, 4, 8, 9; II. 1, 2, 8 – 14, 15b; III. 1; IV. 3; V.1-5.
- Comment not considered to require revision to the 2018 HHERA or additional assessment: I. 3; II. 4, 5; VI. 1.

## **COVER LETTER**

The cover letter states: “No new data was collected for this reporting effort and all assumptions are based on previously collected data that is 18 years old. “

**Response:** The groundwater HHRA update evaluated data from samples collected by HDR from 2012 to 2017, consisting of 1,424 groundwater field samples from wells on or adjacent to the MI. The statement of work included only a review of the soil HHRA and the SLERA; no new samples were collected for soil, surface water and sediment. Based on the findings of the MI RI and the selected remedy in the ROD, only limited sampling and analysis of soil samples from the MI has been conducted since completion of the MI RI, and no surface water or sediment samples have been collected since that time.

## **I. EPA HUMAN HEALTH RISK ASSESSMENT (HHRA) GENERAL COMMENTS:**

1. Review of the Attachment C, Vapor Intrusion Screening Level Assessment, indicates that only select volatile organic compounds (VOCs) were evaluated for vapor intrusion (VI) potential. However, sufficient rationale for use of a truncated list of contaminants of potential concern (COPCs) is not provided, and it is unclear if projected risk and hazard has been underestimated. Revise the VI assessment to include a presentation of risk and hazard predicated on all VOCs that exceed health-based screening criteria, as opposed to select VOCs, or provide data and figures that support use of the truncated list.

**Response:** No change to the 2018 HHERA report, including the VISL assessment, is considered necessary for this comment. Analytical results and risk assessment from the ongoing VI study will be incorporated in an updated HHERA following additional data collection and risk assessment as described in Section 10 of the HHERA Rev0 and in response to these comments.

The VISL assessment was based on identified ground water contaminants, comprised of the VOCs in

**Responses to Comments from  
U.S. Environmental Protection Agency (EPA) Region 4 on:  
Human Health and Ecological Risk Assessment (HHERA), Revision 0  
Defense Depot Memphis, Tennessee  
Comments Received 23 July 2018  
Responses Revised 11 December 2018**

groundwater identified in the ROD as requiring remediation. The VOCs identified in the ROD consisted of PCE and TCE; cDCE, vinyl chloride, carbon tetrachloride and chloroform were added based on LTM sample results indicating the presence of additional VOCs, including degradation products following enhanced bioremediation.

Soil gas samples were collected in August 2018 in accordance with the MI VI Soil Gas Sampling QAPP (HDR 2018). Analyses of soil gas included all TO-15 VOCs. All detected constituents will be compared to screening criteria and laboratory limits will be compared to screening criteria for non-detected analytes. The VI analyses and risk assessment findings will be provided in a technical memorandum for regulatory agency review.

2. As discussed in Section 4.2, Receptors, and stated in Attachment C, Vapor Intrusion Screening Level Assessment, land use controls (LUCs) which prevent residential use of the site have been established for the majority of the Main Installation, except the eastern parcel, which is available for unrestricted use. However, an assessment of VI potential predicated on residential exposure assumptions has not been conducted for the eastern parcel. It is noted that groundwater concentrations detected on and within 100 feet of the eastern parcel exceed residential-use based screening criteria [e.g., trichloroethene has been detected in well MW-50 at a concentration of 3.58 micrograms per Liter ( $\mu\text{g/L}$ ), which exceeds the residential vapor intrusion screening level of 1.2  $\mu\text{g/L}$ ]. Given that the eastern parcel of the Main Installation is available for unrestricted land use, groundwater concentrations detected on and in the vicinity of this parcel should be evaluated for VI potential using residential-use based screening criteria. Revise the human health risk assessment (HHRA) to include this assessment, or provide sufficient rationale for why this assessment is not necessary. Until such time as subsurface soil gas samples are collected, groundwater concentrations of TCE should be compared to both the VI based screening level and the drinking water MCL.

**Response:** No change to the 2018 HHRA report is considered necessary for this comment. Analytical results and risk assessment from the ongoing VI study will be incorporated in an updated HHRA following additional data collection and risk assessment including comparison to residential screening levels.

Soil gas samples were collected in August 2018 at locations considered most likely to contain VOCs in soil and/or groundwater at concentrations that may present a VI human health risk. The soil gas concentrations will be evaluated based on consideration of VOC concentrations in soil and/or groundwater at that location and other factors such as depth to water and soil layering between the water table and the ground surface. Correlation of soil gas and groundwater concentrations should indicate whether additional soil gas samples in areas with lower groundwater concentrations is necessary.

The soil gas analytical results will be evaluated for VI risk based on current and reasonably expected future conditions including use of residential-use based screening criteria. The VI analyses and risk assessment findings will be provided in a technical memorandum for regulatory agency review and will be incorporated in a later HHRA following additional data collection. MCLs are the remediation goals for groundwater at DDMT and the plume maps use the MCL to identify contaminant extent. Since the VI based screening level for TCE (7.5  $\mu\text{g/L}$ ) is higher than the MCL (5  $\mu\text{g/L}$ ), the current maps provide a conservative estimate for potential VI risk.

**Responses to Comments from  
U.S. Environmental Protection Agency (EPA) Region 4 on:  
Human Health and Ecological Risk Assessment (HHERA), Revision 0  
Defense Depot Memphis, Tennessee  
Comments Received 23 July 2018  
Responses Revised 11 December 2018**

3. Review of the Attachment C, Vapor Intrusion Screening Level Assessment, indicates that risk and hazard to a commercial worker were estimated using the Johnson and Ettinger Model (JEM) in addition to EPA's Vapor Intrusion Screening Level Calculator. It should be noted that EPA no longer supports the use of the JEM to contraindicate VI potential where concentrations of contaminants in contributing media (e.g., groundwater) exceed generic VI-based screening levels. The JEM may be used as a supporting line of evidence, but is more often used as a prioritization tool when selecting sampling locations for a VI assessment. It is understood that soil gas sampling to assess the VI pathway is currently planned. Ensure that the JEM is not used as a sole line of evidence to contraindicate VI potential in any forthcoming VI assessment when contributing source concentrations exceed health-based VI screening criteria.

**Response:** No change to the 2018 HHRA report is considered necessary for this comment.

This comment was previously addressed following EPA review of the VI Soil Gas Sampling QAPP. Army agrees that JEM should not be used as a sole line of evidence for VI potential. JEM was used with EPA's VISL calculator to provide a comparison incorporating site-specific information (e.g. depth to water, soil lithology). Use of JEM was discussed with EPA and included in the VI study statement of work (SOW). JEM identified potential VI risk at the MI, although up to an order of magnitude lower than indicated by the VISL calculator results. JEM will also be used with the VISL calculator to evaluate VOC concentrations in soil gas samples in accordance with the SOW.

4. As discussed in Section 8.0, Review of 2000 Soils HHRA, the soil component of the 2000 HHRA was reviewed to determine if "the conclusions of the Soils HHRA are still valid and whether or not the remedial actions completed since that time are protective." The HHRA does not discuss or evaluate if the data used in the 2000 HHRA remain representative of current conditions. As such, it is unclear if the conclusions drawn in review of the 2000 HHRA are appropriate and applicable. Revise Section 8.0 to discuss and evaluate if the data used in the 2000 HHRA remain representative of current conditions.

**Response:** A more detailed review of existing analytical data will be performed; the data review and a sampling plan, if warranted, will be provided in a QAPP.

Additional soil sampling and risk assessment was recommended in Section 10.2 of the HHRA. A more detailed review of existing analytical data will be performed prior to developing the sampling plan. The review will include evaluating whether the 2000 HHRA data remains representative; the data review and the sampling plan will be provided in a QAPP submitted for EPA review.

5. Section 8.0, Review of 2000 Soils HHRA, presents a comparison of exposure point concentrations (EPCs) for contaminants of potential concern (COPCs) selected in the 2000 HHRA to the current EPA Regional Screening Levels (RSLs) for industrial soil. It is unclear if COPCs were appropriately selected in the 2000 HHRA based on review of Section 8.1.2, Soils HHRA Methodology. Therefore, it is unclear if data were inappropriately excluded from the current comparison of EPCs to RSLs. For example, Section 8.1.2 states that frequency of detection and historical use were considered in the selection of COPCs. It is noted that factors such as frequency of detection and historical use are generally inappropriate for use in the selection of COPCs (as opposed to refinement of a target analyte list), unless specifically approved by EPA. If previous agreement has been reached with EPA on this issue, it should be clearly explained in the HHRA. Revise Section 8.0 to provide a table which presents the COPC

**Responses to Comments from  
U.S. Environmental Protection Agency (EPA) Region 4 on:  
Human Health and Ecological Risk Assessment (HHERA), Revision 0  
Defense Depot Memphis, Tennessee  
Comments Received 23 July 2018  
Responses Revised 11 December 2018**

selection process used in the 2000 HHRA such that it can be independently reviewed, and to support the appropriateness of the COPC list used in the evaluation of EPCs against the current RSLs.

**Response:** The language in Section 8.1.2 of the 2018 HHERA will be revised.

In the 2000 HHRA, Section 7.2 incorrectly indicates that frequency of detection and historical use were used as criteria for COPC elimination. Review of Section 7.3 and Appendix D, Table D.1 of 2000 HHRA indicates these criteria were not used to eliminate COPCs.

6. Review of Figure 1-1, Unit Boundaries, indicates that a portion of functional unit (FU)-6 is available for unrestricted use; however, no assessment of the FU-6 soil data used in the 2000 HHRA is presented to demonstrate that the conclusions of the 2000 HHRA are still valid and the remedy remains protective. It is noted that Section 8.3.6, FU6, indicates that concentrations of dieldrin, Aroclor 1260, arsenic, and benzo(a)pyrene remain in FU-6 soil at concentrations that exceed the current RSL for industrial soil; no screening of data in comparison to current RSLs for residential soil is presented. To demonstrate that the conclusions of the 2000 HHRA are still valid and the remedy remains protective at FU-6 it appears that data warrant screening in comparison to current RSLs for residential soil at FU-6. Revise the HHRA to conduct this screening or explain why this is not necessary.

**Response:** Text in Section 8.3.6 of the 2018 HHERA will be revised.

Screening of EPC data, as compared to current RSLs for residential soil is presented in Attachment F, Table 1. Text in Section 8.3.6 will be revised to include the residential assessment for those limited areas of FU-6 as shown on Figure 2-3b of the MI ROD.

7. Based on review of Section 8.3, Review of Current Conditions using 2000 MI RI Data by FU, no assessment of data used in the 2000 HHRA in comparison to current RSLs for residential soil is presented. With the exception of FU-6, it is presumed that this assessment was not conducted as land use controls are in place to preclude residential land use; however, this is not explicitly stated. Revise Section 8.3 to clarify why no assessment of data used in the 2000 HHRA in comparison to current RSLs for residential soil was conducted.

**Response:** Text in Section 8.3 of the 2018 HHERA will be revised.

Text in Section 8.3 will be revised to state the FUs are designated for industrial use by land use controls (except for areas of FU-6). A comparison of the 2000 MI RI soil data to current RSLs for residential use was provided in Attachment F, Table 1.

8. Insufficient data and information are presented in Section 8.0, Review of 2000 Soils HHRA, to allow the reader to understand the concentrations of dioxins/furans that remain onsite and what data set was used in the updated assessment (i.e., selection of maximum concentrations for comparison to current RSLs), and to demonstrate that the dioxin/furan data were appropriately assessed as part of the current HHRA. For example,
  - a. Section 8.2.2.1, Removal Action, states that contamination from the pentachlorophenol (PCP) dip vat and storage tank area was removed to meet a cleanup goal of 200 micrograms per kilogram (ug/kg) for total dioxins/furans. Based on this cleanup level, it

**Responses to Comments from  
U.S. Environmental Protection Agency (EPA) Region 4 on:  
Human Health and Ecological Risk Assessment (HHERA), Revision 0  
Defense Depot Memphis, Tennessee  
Comments Received 23 July 2018  
Responses Revised 11 December 2018**

is unclear if contamination remains onsite that exceeds the current RSL for industrial soil of 0.022 ug/kg for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD) equivalence.

- b. Section 8.2.2.1 also states that contamination was left onsite at concentrations that exceed 200 ug/kg. It is unclear if these data were considered in the current screening of dioxin/furan data.
- c. Section 8.2.2.1 indicates that soil with concentrations below the cleanup goal of 200 ug/kg was used as backfill. It is unclear if these data were considered in the current screening.
- d. The first paragraph on page 8-5 identifies maximum detected concentrations of several dioxins/furans in samples collected from Area 2 that were subsequently covered with gravel. It is unclear if these data were considered in the current screening of dioxin/furan data.
- e. Section 8.2.2.4, Conclusions, indicates that only surface soil data was evaluated as part of the current assessment. It is unclear why subsurface soil data were not evaluated.

Revise Section 8.0 to clarify the data set used in the updated assessment of dioxin/furan data, and provide rationale for the selected data set.

**Response:** A more detailed review of existing analytical data will be performed; the data review and a sampling plan, if warranted, will be provided in a QAPP.

Section 10.2 of the HHERA recommends sampling and additional risk assessment of PCP and dioxins/furans in soils on the Main Installation. A more detailed review of existing analytical data will be performed prior to developing a sampling plan. The review will include the issues raised in the above comments; the data review and the sampling plan will be provided in a QAPP submitted for EPA review.

- 9. The HHRA concludes that “most organic and inorganic constituents detected at the former Depot are present at levels that do not exceed current Industrial RSLs.” The basis for this conclusion is unclear. Review of Sections 8.3.1 through 8.3.6 indicates that polynuclear aromatic hydrocarbons (PAHs), pesticides, polychlorinated biphenyls (PCBs), dioxins, and metals are present in one or more FUs at concentrations that exceed applicable RSLs for industrial soil. Based on this, additional analysis is warranted to demonstrate that the remedy remains protective of an industrial worker. Revise the HHRA to provide this analysis.

**Response:** Additional evaluation of exceedances will be incorporated in an updated HHERA following additional data collection and risk assessment.

The phrase in text stating that “most...constituents are detected ...at levels that do not exceed current Industrial RSLs” indicates that some do, as noted in this comment. Review of Attachment F, Table 1 indicates that approximately 30-40% of the EPCs exceed a RSL. To further evaluate these exceedances, “screening” risks will be calculated by comparing the EPCs to the noncancer and cancer Industrial Soil RSLs in Attachment F, as shown below. The evaluation will be presented in the updated HHERA following additional data collection and risk assessment.

$$\text{Screening Risk} = \frac{EPC}{RSL_{\text{cancer}}} \times \text{Target Risk and}$$

$$\text{Screening Hazard} = \frac{EPC}{RSL_{\text{noncancer}}} \times \text{Target Hazard Quotient.}$$

**Responses to Comments from  
U.S. Environmental Protection Agency (EPA) Region 4 on:  
Human Health and Ecological Risk Assessment (HHERA), Revision 0  
Defense Depot Memphis, Tennessee  
Comments Received 23 July 2018  
Responses Revised 11 December 2018**

10. Several issues were identified in review of Figure 4-1, Human Health Conceptual Site Model:

- a. Figure 4-1 does not identify the groundwater inhalation exposure pathway (e.g., inhalation of VOCs during showering) as complete for a future potential resident, as discussed in Section 4.2.2, Future On-Site Resident. Rather, it appears that the inhalation exposure pathway identified on Figure 4-1 is that associated with the vapor intrusion pathway. It is noted that the groundwater inhalation exposure pathway and vapor intrusion pathway should be listed separately on Figure 4-1.
- b. Figure 4-1 indicates that the vapor intrusion pathway was evaluated for a future potential resident; however, review of the HHRA indicates that this assessment was not completed.
- c. Figure 4-1 does not indicate that the groundwater inhalation exposure pathway was considered to be insignificant for an on-site worker, and was not evaluated in the HHRA, as discussed in Section 4.2.1, Current/Future On-site Worker.

Revise Figure 4-1 to address these issues.

**Response:** Figure 4-1 of the 2018 HHRA will be revised to list groundwater inhalation exposure and vapor intrusion pathways separately; and to indicate that the groundwater inhalation exposure pathway was considered insignificant for an on-site worker.

The VI pathway is presently considered to be incomplete based on depth to groundwater. Previous studies have indicated groundwater contamination beneath the MI should not present a VI risk based on site conditions; however, additional lines of evidence are needed to support the lack of a complete VI pathway. A VI study is currently being performed as a separate task. Soil gas samples were collected in August 2018. The VI analyses and risk assessment findings will be provided in a technical memorandum for regulatory agency review and will be incorporated in a later HHRA following additional data collection.

## **II. EPA HUMAN HEALTH RISK ASSESSMENT (HHRA) SPECIFIC COMMENTS**

### **1. Section 3.1.2, Data Usability, Page 3-2**

This section indicates that the detection limits for up to six VOCs (depending on the date of the data set) were greater than the applicable groundwater screening criteria (i.e., RSLs or the Maximum Contaminant Levels). Noting that the HHRA utilizes data from multiple years (2012-2017) and multiple aquifers, and that data sensitivity issues were not reported for all years, it is unclear if and how this impacted the selection of COPCs. Non-detect chemicals should be retained as COPCs in all instances when a detection limit exceeds the most relevant screening criterion to highlight data gaps and for the purposes of the public record. Revise the HHRA, as applicable, to ensure that non-detect chemicals are retained as COPCs in all instances when a detection limit exceeds the most relevant screening criterion (for every sample collected from a given contact medium), and include a qualitative evaluation of the non-detect COPCs and their influence on the risk assessment in the Uncertainty Analysis (e.g., degree to which the exceedance occurs, likelihood of the contaminant being present above a level capable of eliciting an adverse health effect, etc.). If elevated detection limits do not impact the selection of COPCs due to the availability of multiple data sets, clarify this condition.

**Responses to Comments from  
U.S. Environmental Protection Agency (EPA) Region 4 on:  
Human Health and Ecological Risk Assessment (HHERA), Revision 0  
Defense Depot Memphis, Tennessee  
Comments Received 23 July 2018  
Responses Revised 11 December 2018**

**Response:** An updated HHERA will be prepared following additional data collection and risk assessment. The Uncertainty section will provide a table comparing the detection limits to the minimum of the criteria used in the COPC screening, and information explaining the added uncertainties associated with inclusion of these non-detect chemicals and elevated detection limits.

Evaluating non-detected chemicals as COPCs adds uncertainty to the cumulative risks and noncancer hazards. As noted in RAGS Part A Section 5.3.5:

“Generally eliminate those chemicals that have not been detected in any samples of a particular medium. The outcome of this step is a data set that only contains chemicals for which positive data (i.e., analytical results for which measurable concentrations are reported) are available in at least one sample from each medium. Unless otherwise indicated, assume at this point in the evaluation of data that positive data to which no uncertainties are attached concerning either the assigned identity of the chemical or the reported concentration (i.e., data that are not "tentative," "uncertain," or "qualitative") are appropriate for use in the quantitative risk assessment.”

Further, the 2018 USEPA Region 4 HHRA Guidance does not indicate non-detect chemicals with elevated detection limits should be added as COPCs.

**2. Section 3.3, Identification of COPCs, Page 3-4**

Review of this section and Table 2.1, Occurrence, Distribution, and Selection of Human Health COPCs for Site-Wide Groundwater, indicates that contaminants detected in less than five percent of samples were eliminated as COPCs. This method of selection of COPCs is generally perceived as dated and was in use prior to the widespread and ready-availability of regulatory agency-promulgated health-based screening criteria (e.g., the RSLs). In developing a site-specific COPC list, any contaminant detected at a concentration in excess of the most relevant health-based screening criterion should be retained as a site COPC and evaluated quantitatively and/or qualitatively within the Risk Characterization section of the HHRA. This screening should be conducted irrespective of frequency of detection results for individual constituents. Revise the HHRA accordingly.

**Response:** An updated HHERA will be prepared following additional data collection and risk assessment. Contaminants detected in less than five percent of samples will not be eliminated from the COPC list.

**3. Section 4.4.1.2, Dermal Contact Pathway of Exposure, Page 4-5 and Section 4.4.1.3, Inhalation Pathway of Exposure, Page 4-6**

Two issues were identified in review of these sections:

- a. The first sentence of Section 4.4.1.2 indicates that it is assumed that risk/hazard attributable to dermal/inhalation exposures are equivalent to those attributable to ingestion exposures; however, the second sentence states that the risk/hazard estimates for dermal/inhalation exposures will be double that of the ingestion risk/hazard estimates.
- b. Review of the risk and hazard estimates in Attachment A-1, RAGS Part D Planning Tables 0 to 7.3B, indicates that risk and hazard estimates attributable to dermal

**Responses to Comments from  
U.S. Environmental Protection Agency (EPA) Region 4 on:  
Human Health and Ecological Risk Assessment (HHERA), Revision 0  
Defense Depot Memphis, Tennessee  
Comments Received 23 July 2018  
Responses Revised 11 December 2018**

exposures were generated for an industrial worker. This is not discussed in Section 4.4.1.2 and Section 4.4.1.3.

Revise these sections to clarify that it is assumed that risk/hazard attributable to dermal/inhalation exposures are equivalent to those attributable to ingestion exposures (not double), and that risk and hazard estimates attributable to dermal exposures were generated for an industrial worker.

**Response:** The referenced sections in the 2018 HHERA will be revised in accordance with the comment.

**4. Section 6.4.1, COC Summary by Aquifer and Receptor, Page 6-8**

The third paragraph in this section states, “The constituent 1,2,3-trichloropropane is an artifact of the EBT [enhanced bioremediation treatment] remedy and was detected in only eight wells within the TTA-2 TA [treatment area], with a detected range of 0.694 to 83.3 µg/L between 2012 and 2017. In April 2017, sampling indicated that 1,2,3-trichloropropane was detected in only four wells with a range of 0.694 to 15.9 µg/L.” The significance of these statements and/or the conclusions that can be drawn based on this information are unclear, as they are not discussed. Revise this section to clarify the significance of these statements and/or the conclusions that can be drawn based on this information.

**Response:** No change to the 2018 HHERA report is considered necessary for this comment.

1,2,3-trichloropropane had not been detected prior to the start of enhanced bioremediation treatment and has only been detected in one area (TTA-2) that was impacted by other solvents. Detection may result from being present as a production contaminant in these other solvents; however, if this has occurred, it is limited in scope. TCP will continue to be analyzed during site monitoring, with concentrations and trend analysis to be reported and the need for any remedial action evaluated.

**5. Section 8.1.2, Soils HHRA Methodology, Page 8-2**

The third paragraph on this page concludes that the methodology used in the 2000 HHRA was “relevant and appropriate.” No data or comparison of historical methodology to current methodology are provided to support this statement. For example, no comparison of risk assessment methodology, risk-based screening levels, exposure factor values, or toxicity values used in the 2000 HHRA to current risk assessment methodology, risk-based screening levels, exposure factor values, or toxicity values is presented. Revise the HHRA to provide a comparison of the historical methodology used in the 2000 HHRA to current methodology to support the conclusion that the methodology used in the 2000 HHRA was relevant and appropriate.

**Response:** No change to the 2018 HHERA report is considered necessary for this comment.

The results of the 2000 RA were compared to applicable requirements and criteria based on current guidance to present a forward looking assessment of protectiveness. As noted in Section 6.3.4 of the report, Comparison of Current Risks to the 2000 MI RI Risks, the groundwater component of the 2000 HHRA follows the same general risk methodology and uses the same primary USEPA guidance as the groundwater HHRA update. However, numerous changes in USEPA guidance since 2000 are noted. It is also noted in this section that these and other site-related changes can result in an increase or

**Responses to Comments from  
U.S. Environmental Protection Agency (EPA) Region 4 on:  
Human Health and Ecological Risk Assessment (HHERA), Revision 0  
Defense Depot Memphis, Tennessee  
Comments Received 23 July 2018  
Responses Revised 11 December 2018**

decrease in the calculated risk for the COPCs. The HHRA update was performed to re-evaluate the risks to COPCs in the groundwater to help determine whether or not the remedy remains protective of the potential risks to receptors at DDMT. It is not a straightforward comparison between the 2000 and current risk estimates. See Section 6.3.4 for detailed information in this subject.

**6. Section 8.1.2, Soils HHRA Methodology, Page 8-2**

This section states that the methodology for assessing the toxicity of PAHs and dioxins/furans has changed since completion of the 2000 HHRA. While it appears that data for dioxins/furans was reassessed using current methodology in subsequent sections of Section 8.0, Review of 2000 Soils HHRA, it is unclear if PAH data were reassessed, as this is not discussed further in the HHRA. Revise this section to clarify if PAH data were reassessed, and provide supporting data tables. If they were not, provide rationale for absence of a supporting assessment.

**Response:** Section 8.1.2 in the 2018 HHRA will be revised to clarify that this reassessment was completed in Attachment F, Table 1. The PAHs were assessed by comparing data to current RSLs. The current RSLs incorporate the potency factors for PAHs.

**7. Section 8.2.1, Background Concentrations, Page 8-2**

This section states that background concentrations were calculated as part of the 2000 HHRA; however, it is unclear how the background data were used in the 2000 HHRA as this is not discussed. Revise this section to clarify how background data were used in the 2000 HHRA.

**Response:** Section 8.2.1 in the 2018 HHRA will be revised to clarify the use of background data. Background data is included as a criterion in Section 7.3 text and in the FU-specific COPC selection tables of the 2000 RI. However, no constituents were eliminated as COPCs based on background.

**8. Section 8.2.1, Background Concentrations, Page 8-3**

This section states, "Dioxins and furans were detected in most background soil samples, generally at higher concentrations at the surface than at depth and included octa- and hepta-isomers, indicating an atmospheric deposition source." The range of concentrations detected and the selected background concentrations are not discussed or evaluated. For clarity and completeness, revise this section to present the range of concentrations detected and the selected background concentrations.

**Response:** A more detailed review of existing analytical data will be performed; the data review and a sampling plan, if warranted, will be provided in a QAPP.

As noted in the response to General Comment #8, sampling and additional risk assessment of PCP and dioxins/furans on the MI is planned. A more detailed review of existing analytical data will be performed prior to developing a sampling plan. The data review and the sampling plan will be provided in a QAPP submitted for EPA review.

**9. Section 8.2.2.4, Conclusions, Page 8-7**

According to this section, "The maximum concentration in subsurface soils for TCDD

**Responses to Comments from  
U.S. Environmental Protection Agency (EPA) Region 4 on:  
Human Health and Ecological Risk Assessment (HHERA), Revision 0  
Defense Depot Memphis, Tennessee  
Comments Received 23 July 2018  
Responses Revised 11 December 2018**

equivalents is reported as 13 µg/kg (MI RI Table 22-7); given that the range of other values for the UCLs [upper confidence limit] and EPCs in the 2000 MI RI is orders of magnitude lower, this is considered to be a typographical error.” The conclusion that this value is an error is not supported. A data review is not presented to support that this value is an error. In addition, the range of other values is unclear. Revise this discussion to provide additional data analysis to support the conclusion that this value is an error.

**Response:** A more detailed review of existing analytical data will be performed; the data review and a sampling plan, if warranted, will be provided in a QAPP.

Army agrees this error cannot be verified given the documentation available. This comment will be addressed during the additional review and data collection.

**10. Section 8.2.2.4, Conclusions, Page 8-7**

This section states, “There are no exceedances of human health screening levels [for dioxins/furans] in sediment, as there are no generic human health sediment criteria.” If industrial workers and/or future potential residents are expected to be exposed to sediment it may be appropriate to screen sediment data against the RSLs for industrial and/or residential soil. Revise this section to clarify which receptor populations are expected to be exposed to sediment, and present a screening of sediment data for dioxins/furans against the RSLs for industrial and/or residential soil. Alternatively, clarify why this is not necessary.

**Response:** A more detailed review of existing analytical data will be performed; the data review and a sampling plan, if warranted, will be provided in a QAPP.

The dioxins/furans sediment data will be reviewed against soil RSLs during the additional review. Text will be provided in the updated HHERA with additional details on potential exposure scenarios and a determination of the need for further screening.

**11. Section 8.2.2.4, Conclusions, Page 8-7**

This section indicates that concentrations of dioxins/furans detected in surface water “were compared to their respective state and USEPA water quality criteria....” No tables are presented to support this discussion. Therefore, the concentrations relative to the screening criteria are unclear. Revise this section to provide supporting surface water screening data tables.

**Response:** A more detailed review of existing analytical data will be performed; the data review and a sampling plan, if warranted, will be provided in a QAPP.

Surface water screening data tables with current state and USEPA water quality criteria will be provided following the additional review.

**12. Section 8.5, Conclusions, Page 8-12**

The last bulleted item on this page concludes that further investigation of arsenic in soil is not warranted as concentrations are “within the range of background concentrations,” although they exceed the RSL for industrial soil. Additional discussion is needed to support this conclusion. For example, this section does not discuss the range of detected arsenic concentrations compared to the range of site background concentrations. In addition, no evaluation as to

**Responses to Comments from  
U.S. Environmental Protection Agency (EPA) Region 4 on:  
Human Health and Ecological Risk Assessment (HHRA), Revision 0  
Defense Depot Memphis, Tennessee  
Comments Received 23 July 2018  
Responses Revised 11 December 2018**

whether historical operations at the site could have contributed to arsenic contamination is presented. Revise the HHRA to provide additional data and discussion to support the conclusion that no further investigation of arsenic in soil is warranted.

**Response:** A more detailed review of existing analytical data will be performed; the data review and a sampling plan, if warranted, will be provided in a QAPP.

The available data for the range of detected arsenic concentrations compared to the range of site background concentrations and potential for arsenic contamination by historical operations at the site will be provided in the QAPP following the additional review.

**13. Section 8.5, Conclusions, Page 8-13**

The first bulleted item on this page states, "Other areas where dioxins/furans were detected but no LUCs were instituted may also require review and additional risk management decisions based on analytical results. This includes shallow and deeper soils within a portion of FU3 and FU4, as well as other media to ensure both human health and ecological risks are properly addressed." The areas to which this statement is referring are unclear, as no figures are provided that depict the locations of dioxin/furan exceedances and/or areas at which LUCs due to dioxin/furan contamination have been implemented or are required. In addition, it is unclear what other media are of concern. Revise the HHRA to address these issues.

**Response:** A more detailed review of existing analytical data will be performed; the data review and a sampling plan, if warranted, will be provided in a QAPP.

This comment, including preparation of figures showing sample locations for existing dioxins/furans data and the areas where associated LUCs were implemented, will be provided in the QAPP following the additional review.

**14. Section 8.5, Conclusions, Page 8-13**

The last bulleted item on this page states, "These restricted areas are largely co-located, as PCP use is a likely source of the dioxins in soil." It is unclear to what areas this statement is referring. Revise this statement to clarify this and provide a supporting figure.

**Response:** A more detailed review of existing analytical data will be performed; the data review and a sampling plan, if warranted, will be provided in a QAPP.

The requested figure will be provided in the QAPP following the additional review.

**15. Attachment A-1, RAGS Part D Planning Tables 0 to 7.3B, Table 1, Selection of Exposure Pathways.** Two issues were identified in review of this table:

- a. Section 4.2.2, Future On-Site Resident, indicates that the groundwater inhalation exposure pathway was quantitatively evaluated for a future potential resident, as does the "Rationale for Selection or Exclusion of Exposure Pathway" column of Table 1; however, the "Type of Evaluation" column of Table 1 indicates that this pathway was qualitatively evaluated.

**Responses to Comments from  
U.S. Environmental Protection Agency (EPA) Region 4 on:  
Human Health and Ecological Risk Assessment (HHERA), Revision 0  
Defense Depot Memphis, Tennessee  
Comments Received 23 July 2018  
Responses Revised 11 December 2018**

b. The “Rationale for Selection or Exclusion of Exposure Pathway” column of Table 1 states that the VI pathway was evaluated for a future potential resident; however, review of the HHRA indicates that this assessment was not completed.

Revise Table 1 to address these issues.

**Response:** Table 1 of the 2018 HHERA will be revised in accordance with comment 15.a.

Analytical results and risk assessment from the ongoing VI study will be incorporated in an updated HHERA following additional data collection and risk assessment. Comment 15.b will be addressed in the update.

16. **Attachment A-1, RAGS Part D Planning Tables 0 to 7.3B, Tables 3.1 through 3.3, Exposure Point Concentration Summary for Groundwater** These tables indicate that risk and hazard to a construction worker were evaluated in the HHRA; however, this is not the case. Revise these tables to remove reference to assessment of construction worker exposures.

**Response:** Tables 3.1-3.3 of the 2018 HHERA will be revised in accordance with the comment.

### **III. ECOLOGICAL RISK ASSESSMENT (ERA) GENERAL COMMENT:**

1. Based on review of the tables included in Appendix G, it is unclear why hazard quotients (HQs), especially for the chemicals of potential concern (COPCs) that exceed screening levels are not calculated. Revise the tables in Appendix G to calculate HQs for those COPCs that exceed their respective screening levels. This requested change will greatly facilitate the review process.

**Response:** The need for a SLERA will be evaluated and recommendations provided following additional sampling and risk assessment. Calculation of HQs for the ERA was outside the SOW for the 2018 HHERA.

### **IV. ECOLOGICAL RISK ASSESSMENT (ERA) SPECIFIC COMMENTS:**

**1. Section 9.2.3, Off-site Surface Water Transport, Page 9-5:**

The link to the Nonconnah Creek Watershed (08010211) of the Mississippi River Basin Water Quality Management Plan does not work and should be updated to include the following link: [https://www.tn.gov/content/dam/tn/environment/water/documents/wr-ws\\_watershed-plan-nonconnah-2002.pdf](https://www.tn.gov/content/dam/tn/environment/water/documents/wr-ws_watershed-plan-nonconnah-2002.pdf). Revise accordingly.

**Response:** The link will be updated in the 2018 HHERA.

**2. Section 9.2.3, Off-site Surface Water Transport, Page 9-5:**

The last paragraph in this section indicates that the potential transport of dioxin/furans warrants additional evaluation in accordance with the Tri-Service Environmental Risk Assessment Workgroup Questions/Answers on Dioxin (TSERAWQ, 2013). The link to TSERAWQ, 2013 is provided in Section 8.2.2.4, Conclusions, and Page 8-7 of the HH/ERA, but did not work.

**Responses to Comments from  
U.S. Environmental Protection Agency (EPA) Region 4 on:  
Human Health and Ecological Risk Assessment (HHERA), Revision 0  
Defense Depot Memphis, Tennessee  
Comments Received 23 July 2018  
Responses Revised 11 December 2018**

Revise the HH/ERA to include the appropriate link such that the applicability of the protocol for further ecological risk evaluation can be determined.

**Response:** The link will be updated in the 2018 HHERA.

**3. Section 9.4, Conclusions, Page 9-12:**

The first paragraph in this section indicates that the levels of certain COPCs in surface soil, sediment, and surface water collected in 2000 exceed the current March 2018 USEPA Region 4 ecological screening levels. However, because complete ecological exposure pathways are not present, on-site ecological risk at the Main Installation (MI) is considered minimal. While, this statement is accurate, select sections of the HH/ERA present contradictory information. For example, Section 9.3.3.2, Current Review Conclusions, Page 9-8 states, "HDR's review of the 2018 ecotoxicity criteria, detected COPC concentrations and site conditions support the general conclusion in the 2000 MI RI. However, further review is recommended for COPCs in soil that exceed current criteria, as described in Section 9.4." Therefore, it is unclear how COPCs that exceed current ecological screening levels will be evaluated. Revise Section 9 of the HH/ERA to clarify how COPCs that exceed screening levels will be evaluated.

**Response:** Text will be reviewed based on available information and inconsistencies will be eliminated in the 2018 HHERA revision.

Additional data collection and risk assessment for site contamination is planned, and an updated HHERA will be prepared. The need for a SLERA will be evaluated and recommendations provided in the updated HHERA.

**4. Figure 2-21, Conceptual Site Model for Potential Human and Ecological Exposures: Function Units 1-6, Memphis Depot Main Installation ROD:**

An apparent typographical error is present on Figure 2-21. For example, the last two blocks under "Secondary Source of Contamination" should be Onsite Surface Water and Onsite Sediment as opposed to Onsite Surface Soils and Onsite Subsurface Soils. Revise Figure 2-21 to address this typographical error.

**Response:** Figure 2-21 in the 2018 HHERA will be revised in accordance with the comment.

**Responses to Comments from  
U.S. Environmental Protection Agency (EPA) Region 4 on:  
Human Health and Ecological Risk Assessment (HHERA), Revision 0  
Defense Depot Memphis, Tennessee  
Comments Received 23 July 2018  
Responses Revised 11 December 2018**

**REVIEW OF ECOLOGICAL ASPECTS OF THE REVISION 0 HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENT, MAIN INSTALLATION, DEFENSE DEPOT, MEMPHIS, TENNESSEE**

**From EPA Scientific Support Section, Sharon R. Thoms, June 18, 2018.**

*General Comments to RPM* on pages 1 to 6 provide a brief summary of site conditions and the SLERA review within the HHERA report. Responses to comments in this section are not considered necessary, with the exception of Item 2 on page 2, which states “The text described the BERA step as having begun, however, the document did not complete the elements of the BERA.” Army notes that the statement of work was limited to a review of the SLERA based on changes in applicable guidance since the time the original document was prepared. Army requests that the USEPA RPM forward any other comments in this section which require response.

**V. GENERAL COMMENTS TO DoD:**

1. Conclusions underemphasize chemicals exceeding ESVs and industrial RSLs at multiple FUs. Often the same chemicals that exceeded the industrial RSLs exceeded the ESVs. Please revise the document to include itemized data tables and figures for each FU showing the locations of exceedances of ESVs and industrial RSLs with respect to site features, land cover, land use, greenspaces, waterbodies, and footprints of removal actions.

**Response:** This comment will be addressed in the updated HHERA following additional data collection and risk assessment.

2. Figures showing the locations of surface water and sediment samples should be provided along with tables of itemized data.

**Response:** Updated figures to address this comment will be provided in the updated HHERA following additional data collection and risk assessment.

3. The 2018 Region 4 Supplemental Ecological Risk Assessment Guidance has narrowed the set of circumstances where a site can exit the ERA process after completing the SLERA to sites having buildings and parking lots with vegetation limited to grassy strips and sites where addressing human health risks will adequately address ecological risk concerns. The review has not addressed this aspect of the revised guidance. The screening level problem formulation is not of sufficient detail to support a discussion of potentially complete exposure pathways to various receptor groups, as this occurs in the BERA. The discussion of incomplete exposure pathways depends on how the land is being managed to exclude exposure to wildlife. If the property will be turned over to private use, the land use will likely change. It is uncertain whether the reduced use by wildlife will continue or whether land use controls are needed.

**Response:** The need for a SLERA will be evaluated and recommendations provided in the updated HHERA report. The assumption that future land use is likely to change may be inaccurate; it is more likely to remain industrial based on current and proposed activity, facility management plans and zoning.

**Responses to Comments from  
U.S. Environmental Protection Agency (EPA) Region 4 on:  
Human Health and Ecological Risk Assessment (HHERA), Revision 0  
Defense Depot Memphis, Tennessee  
Comments Received 23 July 2018  
Responses Revised 11 December 2018**

4. The ecological risk assessment review of the 2000 SLERA should contain an uncertainty section and discuss how sediment and surface water samples were available from drainage pathways leading from FU2 and FU4 but not from the other functional areas. Other limitations such as the age of the data should be discussed.

**Response:** The need for a SLERA will be evaluated and recommendations provided in the updated HHERA report.

5. The report recommended additional assessment of COPCs in soils exceeding the ecological criteria for their potential to serve as sources of contamination delivered by stormwater runoff to off-site surface water bodies. The exposure pathway to ecological receptors of soil contamination from the DDMT washing off into the off-site waterways is complete. Several chemicals detected in surface water exceeded TDEC standards for fish and aquatic life. Please estimate the total mass of CERCLA contaminants in each FU to evaluate whether there is a potential source to the waterways.

**Response:** The need for a SLERA will be evaluated and recommendations provided in the updated HHERA report.

The assumptions that the exposure pathway is complete and the site is a continuing source of runoff to surface water are in question and require further analysis. Estimating total mass of CERCLA contaminants to evaluate if there is a potential source to the waterways is not recommended, as noted in EPA guidance at [https://icis.zendesk.com/hc/en-us/article\\_attachments/202335086/ref10vcmaappendixa.pdf](https://icis.zendesk.com/hc/en-us/article_attachments/202335086/ref10vcmaappendixa.pdf).

## **VI. SPECIFIC COMMENTS TO DoD:**

1. Tables F-1 and G-1. The exposure point concentration for lead in FU3 in Table F-1 is 311 mg/kg, whereas the exposure point concentration for lead in FU3 in Table G-1 is 4,160 mg/kg. Please address this inconsistency.

**Response:** No change to the 2018 HHERA report is considered necessary for this comment.

Review of the original data in the 2000 MI RI, Table 18-1 indicates the range of detected concentrations for lead is 2.8 mg/kg to 4,150 mg/kg (value of 4,160 appears to be a typo in comment) and the arithmetic mean is 244 mg/kg. Table F-1 presents the 95% UCL data, which is the upper estimate of the true population mean. For the HHRA, applying the maximum detected concentration of 4,150 mg/kg in the COPC screening step and then applying the EPC (e.g., 95% UCL) in the risk calculations is standard national USEPA practice. In comparison, for the SLERA, only the maximum detected concentrations (i.e., 4,150 mg/kg) were used in the comparison for this screening assessment, which is standard practice and explains the difference in EPC values between the HHRA and SLERA. Applying 95% UCLs as an estimate of exposure is typically not done until Step 3A or in a full BERA.
