**Re:** **Fluvial Soil Vapor Extraction (SVE) – Operations Summary #7**  
**Dunn Field Source Areas Remedial Action**  
**Defense Depot Memphis, Tennessee**  
**FA8903-04-D-8722, TO 0031**

This memorandum summarizes operations of the Fluvial SVE system from 2 May 2008 through 1 August 2008 (reporting period) and includes operational data and field and laboratory sampling results.

The Fluvial SVE system consists of two 13.1 hp regenerative blowers connected to seven SVE wells. The SVE wells have screen lengths of 25 to 35 feet with the screened interval ranging from 29 to 73 feet below ground surface. Condensate from the SVE wells is removed via a 140-gallon air/water separator and stored in a 535-gallon tank for analysis prior to discharge to the sewer system. If necessary to control VOC emissions, the extracted air flows through two 2,000-pound granular activated carbon (GAC) vessels prior to discharge. No emission controls are currently being used and extracted vapor is being emitted directly to atmosphere. There are 20 vapor monitoring points (VMPs) located 15 to 80 feet from the SVE wells. Fluvial SVE operations began on 25 July 2007. The Fluvial SVE system lay-out is shown on Figure 1.

## FLUVIAL SVE OPERATIONS SUMMARY

System uptime was over 98% for the reporting period with both blowers in operation for 100% of the time. System shutdowns were made to collect photoionization detector (PID) measurements and laboratory samples at VMPs and to perform general system maintenance. Quarterly laboratory samples were collected from VMPs and SVE wells on 16 July 2008 and from system influent on 17 July 2008. The GAC treatment system remains offline due to low volatile organic compound (VOC) concentrations which are below Memphis Shelby County Health Department (MSCHD) permit limits.

System flow rates and vacuum measurements are shown on Table 1. Flow rates at individual wells are measured by a vane-type meters at the piping manifold. System flow rates are measured by a mass-flow meter. The system is currently operated with all SVE wells in the 100% open position. Individual well flow rates vary from 20 to 190 actual cubic feet per minute (acf m) with both blowers operating and are similar to previous readings. The lower flow rates

and higher vacuums at SVE-A and SVE-G are attributed to these wells being screened in tighter formations than other SVE wells. Combined flow from all SVE wells is approximately 740 standard cubic feet per minute (scfm) at 5.2 inches of mercury (in. Hg.) with both blowers operating.

Vacuum measurements collected at vapor monitoring points (VMPs) during the reporting period are shown on Table 2. Measurements continue to indicate vacuum influence at distances greater than 80 feet from all SVE wells.

### PID FIELD MEASUREMENTS

VOC concentrations are estimated through field measurements at individual SVE wells, system influent, and VMPs with a MiniRae 2000 (10.6 eV lamp) PID. PID measurements are made by drawing vapor into a teflar bag using a sampling pump.

PID measurements from SVE wells and system influent are shown on Table 3. System influent PID measurements ranged from 2.9 to 23.8 parts per million (ppm) during the reporting period. Increases in PID measurements at several SVE wells (SVE-B, -C, -D, and -G) and the system effluent since early June 2008 are attributed to thermal SVE operations; soil heating for the thermal SVE began on 27 May. PID readings showed little variation at SVE-A, -E, and -F since the onset of thermal SVE operations. The trend in PID measurements at SVE wells is shown on Figure 2.

Quarterly PID measurements at VMPs were collected on 16 July 2008. The SVE system is shutdown for two to four hours prior to the measurements. The VMPs are purged using the sampling pump until three consecutive PID readings are within 10%. The final PID measurements at each VMP are shown on Table 4. Increases in PID measurements (greater than 100%) were seen at several shallow VMPs (VMP-2B, -3B, -5B, -6B, -7B, and -8B). The trend in PID measurements at -A VMPs is shown on Figure 3 and -B VMPs on Figure 4.

### LABORATORY ANALYSES

#### Annual VMP Samples

Laboratory samples were collected from all VMPs on 16 July 2008. Samples were collected in SUMMA canisters immediately following purging and PID measurements. Analytical results from the Baseline samples (collected on 25 July 2007 prior to system startup) and the Year 1 samples (collected on 16 July) are shown on Table 5. The table presents the analytical results for all constituents detected above the reporting limit in one or more samples. Large increases in CVOC concentrations were reported in VMP-2B, -3B, -5B, and -6B. CVOC concentrations in other VMPs have decreased over 90% from Baseline samples.

#### Quarterly SVE Samples

Laboratory samples were collected from all SVE wells on 16 July and from the system influent on 17 July 2008 (3Q08 event). Samples were collected directly into SUMMA canisters. Analytical results are shown on Table 6 for the influent system sample and on Table 7 for SVE well samples. Historical sample results for primary CVOC constituents at all SVE wells and system influent are on Table 8.

Total CVOCs in the 3Q08 treatment system influent (11,557 parts per billion by volume [ppbv]) continue to slowly decrease. The primary CVOCs detected in the influent sample are similar to

previous samples: trichloroethene (TCE) at 59%; 1,1,2,2-tetachloroethane (TeCA) at 23%; cis-1,2-dichloroethene (cDCE) at 12%, and chloroform at 4%. System influent concentrations trends are plotted on Figure 5.

3Q08 CVOC concentrations increased significantly at SVE-C, SVE-D, and SVE-G. A significant decline was seen at SVE-A where total CVOC concentrations decreased to 24.1 parts per million by volume (ppbv) from 5,095 ppbv in 2Q08. CVOC concentrations at SVE-B and -E, continue to be fairly steady since 4Q07 (Table 8) and are below 40 ppbv (3Q08). Total VOC concentrations also continue to remain below 40 ppbv at SVE-F after peaking at 981 ppbv in 1Q08. The primary CVOC in each SVE well was TCE in SVE-A, -B, -D, -E and -F; TeCA in SVE-C; and chloroform at SVE-G. The trend in total VOC concentrations at SVE wells and influent is shown on Figure 6.

### FLUVIAL SVE MASS ESTIMATES

VOC concentrations in the influent sample (based on TCE, the primary constituent), system operating hours and flow rates were used to calculate the VOC mass removed from the fluvial soils. VOC concentrations used for mass calculations are shown on Table 9. Mass emission calculations are shown on Table 10.

Influent emission rates are estimated at 0.17 pounds per hour (lb/hr). The MSCHD Operations Permit 01030-01PC for the Fluvial SVE system has a maximum VOC emission limit of 5.71 lb/hr. The Fluvial SVE system removed approximately 471 pounds of VOCs between the 2Q08 and 3Q08 sample events and 2,788 pounds of VOCs since system startup (Table 10).

### CONCLUSIONS AND RECOMMENDATIONS

The fluvial SVE system continues to remove VOC mass from the fluvial subsurface. System uptime during the reporting period was above 98%. Approximately 2,788 pounds of VOCs have been removed from the subsurface since startup. The GAC filters remain offline with discharge directly to atmosphere based on continued emission rates well below permit limits.

3Q08 samples collected from SVE wells, system influent, and VMPs show that thermal SVE operations in the overlying loess formation are contributing to increases in CVOC concentrations at several wells and VMPs. At VMPs, the increases were limited to shallower (-B) VMPs while concentrations generally decreased in deeper (-A) VMPs. Increasing soil temperature from the thermal SVE operations are apparently mobilizing CVOCs from the loess into the upper fluvial formation. Increased CVOC concentrations were also evident in SVE-C, -D, and -G.

System influent total CVOC concentrations were at 11,557 ppbv and continue to show an asymptotic decreasing trend. TCE continues to be the primary CVOC detected in the system influent (comprising 59% of the total concentration).

Based on the quarterly sample results and field measurements, VOC mass remains in the Fluvial subsurface and continued SVE operations are warranted at all SVE wells. Weekly PID readings from the system influent and SVE wells will be used to monitor system emissions and the impact from the thermal SVE system. PID readings will be collected from VMPs on a quarterly basis. Laboratory samples will be collected from SVE wells and system influent in October 2008 (4Q08 event).

## TABLES

- 1 System Flow Rate and Vacuum Readings
- 2 System Vacuum Readings at VMPs
- 3 PID Measurements at SVE Wells

(1) - Vacuum measured at blower manifold.

(2) - For all wells, except SVE-C, units are in in. H<sub>2</sub>O from 11/29/08 to present. For SVE-C, units are in in. H<sub>2</sub>O from 12/21/08 to present.

(3) - To minimize system operation time, the SVE system was online for laboratory sampling only from 11:00 AM to 12:00 PM.

(4) - Readings below 1 in. Hg. are too low to be registered on vacuum gauges which have a span of 0 - 30 in. Hg. Vacuum gauges with a smaller span installed on all wells but SVE-C (shipped inoperable) on 28 November 2007. New gauge are in units of inches of water (in. H<sub>2</sub>O) and have spans of 0 to -10 in. H<sub>2</sub>O (0 to 7,353 in. Hg.)

(5) - Replacement gauge for SVE-C installed on 21 December 2007.

(6) - SVE-E damaged during other onsite remedial action activities and was offline during 3/14/08 inspection. No reading collected.

(7) - Rebound Event #1 occurred from 3/20/08 to 04/17/08. SVE-B, SVE-E, and SVE-F were offline during this period.

(8) - Gauge could not be read due to debris/grime in site glass.

SVE-D valve left in closed position following system tests on 9/19/07.

N/R : not recorded

scfm: standard cubic feet per minute

in. Hg. = inches of mercury

in. H<sub>2</sub>O - inches of water0.07353 x in. H<sub>2</sub>O = in. Hg.

NR = not recorded

(1) = 0.0733 x In. H<sub>g</sub>O = In. Hg.

(2) = All VMP wells contain 8-foot screen lengths. VMP "A" wells (e.g., VMP-1A) were constructed with a screen located near the bottom of the screen of the associated SVE well.

VMP "B" wells (e.g., VMP-1B) were constructed with a screen located near the top of the screen of the associated SVE well.

(3) = Rebound Event #1 occurred from 3/20/08 to 04/17/08. SVE-B, SVE-E, and SVE-F were offline during this period.

(4) = Vacuum readings affected by debris lodged in tubing. Debris was removed and tube length shortened by 6 inches on 9/14/07.

(5) = VMP-8A and VMP-6B are located equidistant from SVE-D and SVE-E.

(6) = Vacuum gauges with a smaller span used on readings after 11/29/07.

Note: Vacuum gauges with a smaller span used on readings after 11/29/07.

In. Hg. = Inches of mercury

In. H<sub>g</sub>O = Inches of water

Shaded Cells indicate SVE well offline.

(1) = Photo Ionization Detector (PID) manufactured by RAE System (Model: MiniRAE 2000) with a 10.6 eV lamp.

(2) = Influent stream exceeded maximum range of PID meter (10,000 ppm).

(3) = PID reading not collected as treatment system was taken offline following 5 October 2007 readings.

(4) = SVE-E damaged during other onsite remedial action activities and was offline during 3/14/08 inspection. No reading collected.

(5) = Rebound Event #1 occurred from 3/20/08 to 04/17/08. SVE-B, SVE-E, and SVE-F were offline during this period.

(6) = PID readings believed to be in error due to malfunctioning PID. Readings recollected on 6/30/08.

ppm: parts per million

PID: photoionization detector

(1) Photo Ionization Detector (PID) manufactured by RAE Systems (Model: MinIRAE 2000) with a 10.6 eV lamp.

(2) All VMP wells contain 5-foot screen lengths. VMP "A" wells (e.g., VMP-1A) were constructed with a screen located near the bottom of the screen of the associated SVE well. VMP "B" wells (e.g., VMP-1B) were constructed with a screen located near the top of the screen of the associated SVE well.

(3) Measurements collected prior to system startup.

(4) Measurements collected while system offline. System offline for two hours prior to collection of PID readings.

(5) Measurements collected prior to shut down of SVE wells as part of rebound study.

(6) Influent stream exceeded maximum range of PID meter (10,000 ppm).

(7) N/C - Rebound Event #1 occurred from 3/20/08 to 04/17/08. PID readings only collected on VMPs associated with those offline wells. No PID readings collected from VMP-1A/B, VMP-3A/B, VMP-4A/B, VMP-5A/B, VMP-9A/B, and VMP-10A/B.

ppm: parts per million

**Notes:**

- (1) Laboratory sample total VOC concentration used for calculation. If no sample was collected or results are not available, then concentration is half of the PID reading unless otherwise noted. PID readings more accurately reflect declining concentrations trends.
- (2) Concentration is average of concentrations from 07/25/07 and 07/27/07.
- (3) To minimize system operation time, the SVE system was online for laboratory sampling only.
- (4) Concentration is average of concentrations from 08/03/07 and 08/18/07.
- (5) Concentration estimated to be 0 ppb following carbon change out.
- (6) Treatment system offline. VOC influent concentration used for mass emission calculation.
- (7) Start of Rebound Event #1. No sample collected. Concentration is 98.2% of concentration from 1/17/08 and is based on mass rates from four online SVE wells prior to shutdown.
- (8) End of Rebound Event #1. No sample collected. Concentration from PID readings.
- (9) No sample collected. Used VOC concentration from 07/16/08.
- NR: PID reading not collected
- NS: Sample not collected.
- N/C: Not sample collected. Treatment system offline.
- N/A: Not applicable.

**Notes:**

- (1) Calculation based on TCE which is the primary constituent.
- (2) Calculation based on xylene (primary constituent from sample collected 07/25), cis-1,2-DCE (primary constituent from sample collected on 8/03/07), vinyl chloride (primary constituent from samples collected on 8/16 and 8/23), or TCE (primary constituent from sample collected on 9/19/07 and 10/18/07).
- (3) GAC replaced on 13 August 2007.
- (4) GAC replaced on 26 December 2007.
- (5) Rebound Event #1 occurred between 03/20/08 and 04/17/08. SVE-B, SVE-E, and SVE-F were offline.
- N/A: Not applicable. Treatment system taken offline on 10/05/07.
- N/C: No sample collected. Treatment system offline. Influent emissions rates used for effluent emission rates.
